Hi

I am looking for the modification of the Icom 729 TX Band as i would like to install the radio in a yacht and would like to use it for both ham radio and marine use. I know there is a mod for doing this but cannot find out how to do it.

If anyone knows it, not the mod of D8, could you please Email me at the following address : seanmcd@iafrica.com

thanks
Marc ZS5MMD

Hello Marty, the name here is Jim and the callsign is KE3OP. The best advice I can give you is to go on the repeater system on either 443.800 which is the input near Valley Forge or 443.450 which is the input in center city Philadelphia. The PL for either input is 131.80. I'm sure if you put a query out on the air someone will be happy to assist. I am on their system frequently. Best of luck.

You should be able to get a short piece of ribbon cable at and
electronic shop doing repairs on digital equip. Or try local computer
dealers, sometimes they keep it to make up drive cables. Just peel
away and extra conductors you don't need.

If you can't find any let me know the length and how many conductors
you need.

Help?

I have Logic 4 (Windows) and I'm trying to hook up the rig control program to my TS-870S. So far, although I've tried various settings, I can't seem to get it to work.

The radio comes with a 9 pin computer interface built in, and works well through the computer with the Kenwood Computer Rig Control Program, so I know the computer to rig cables, settings, and stuff do work.

The radios on com 1, and the baud can be varied from 9600 to 57600. I've tried about every baud setting (changing the radio menu setting too), but Logic won't read the freq, etc. The ctrl light comes on the radio, but Logic gives me a error for com port and says it cant read the radio! I haven't set the address in logic, because it says you don't need to for Kenwoods?

Does anyone use the Logic 4 interface program? Can you help?

Reply by email if you can ok?

Robert

I had problems with my unit also. My problem is the crystal oscillator
that provides the boud rate clock for the seial port. The factory
said to replace the crystal but I changed the value of one of the
capacitors at the crystal and that got the oscillator going
again. Check for the clock for the serial port. If its not there
you have the same problem as I did.

Iï¿½m using a Motorola Spkr/mic on a Yaesu FT-51 HT (same connector, characteristics and wiring as the Icom). There are two problemsï¿½

1) the spacing on the two pins is slightly closer than that on the Yeasu/Icom connector, and the plug won't directly fit into the radio. I did some surgery on the connector and moved the pins a little farther apart, and set the change in epoxy. It works great.

2) the wiring on the mic is different than that on the Yaesu. I took the mic apart, and after a half-hour with the ohm-meter, I got it wired to work with the Yaesu.

It was a pain to make it work, but it sound as good as if not better than the factory mic, and is fairly weather-proof. Considering I paid $3 for the mic at Dayton, and used 50 cents in parts, it was worth it.

What band is the radio? Motorola uses different multipliers
depending on the frequency band the radio is on. If you are
looking to but crystals for the unit, I highly recommend
BOMAR crystal at 800-526-3935.

The PL can be changed by swapping reeds or "Permacode" tone plugs.

E-mail me withe specifics and I'll try to help you out.

Steve,

I had a similar problem when I set up my Kenwood TM-733A for crossband
repeat.

I solved it by disconnecting the microphone - which was hot whenever
the unit was transmitting.

Perhaps this will work for you. Just a thought. Best of luck.

Hi Norm--

In your post you wrote:

> if it isnt open power doesn't make a difference.
>The 3 el beam is fine when the band is open.

In my experience, this is not entirerly true. A 150-watt brick and 8-10 dB gain in your antenna system will enable you to go "one step further" by (a.) making double-hop contacts much more reliably (b.) opening up contact possibilities through aurora, scatter, etc., (c.) lenghtening out coverage when the band is closed or on inversion and ducting enhancements, and (d.) simply being more competetive. The next step after that is to move onto a mountain top and run a Kw. Then, yet another world opens up.

From: lee garlock <leeg@erols.com>
Message-ID: <32ED02D7.4D72@erols.com>
Source record: 184894

After getting several complaints about tinny audio on FM I checked the freq. response of the FT 726 mic chain to the varacter diode modulator, on FM it was way down below 1 kHz, the seperate audio chain for SSB was flat, on FM it was way up at 3 kHz compared to 300 Hz..Apparently by design, I replaced a 0.15 ufd cap in FM audio amp emitter bypass with a 1 mfd cap and its flat now 400 Hz to 3 kHz and I get FB audio reports...Why was the rig like this? and why did it become a large problem..I know FM can use some pre-emphasis ..

Hi, I have an AZDEN AZ-11 handheld 10-meter radio for sale.

It is in mint condition and comes with a charger, battery, vinyl case,
and speaker mic.

It also has an extra "high gain" telescoping antenna. It has all of the
manuals, box and origional (warantee / registration slip) not filled out.

New price for the above is around $500.

I am selling it for $300.

I would consider trades for 1.2 Ghz equipment (radios or duplexers)

If you are interested please e-mail.

Thanks,

Scott Sidener N0WFL sidener@umr.edu

For Sale: Yaesu FT-2700RH 2m/70cm dual-band FM radio $275

FTS-8 CTCSS Tone Encoder and Decoder *installed*
MH-15a8 DTMF Up/Down Tuning/Scanning Microphone
MMB-27 Mobile Mounting Bracket (Quick Release)

All original manuals and documentation included.

RF Output 25W High, 3W Low (both bands); separate output connectors.
Tuning 140-150 MHz in 5 kHz or 10 kHz steps
440-450 MHz in 12.5 kHz or 25 kHz steps
Fast tuning in 1 MHz steps, both bands.
Full Duplex Full Duplex (TX on one band, RX on other) switch selectable.
Memories 10 (8 can store odd split, all store CTCSS tones)
VFOs 2 (both can be used together for odd splits)
Calling Freq Programmable
Scanning Memory scan--any memory can be locked out.
Band Scan--entire band or programmed band limits.
Resume on carrier drop or 6s time delay, both scan modes.
Reverse For checking repeater input frequency.
Dim Selects brightness level of display and panel lamps.
Burst European 1750 Hz repeater burst tone built-in.
Heat Sink Entire Chassis is diecast aluminium heat sink.
External Spkr 1/8" 2-conductor jack for external 4-16 ohm speaker.

Radio is in very good condition, and in daily use on both 2m and 70cm.

> Lee, KD4RE
>
>

Lee,

I can't say for sure, but I am assuming that the problem just being found, that you
are not the original owner. A lot of 726r and 736r rigs were used for satellites,
including the paksats at 9600 BPS. There was a popular modification to tap direct to a unfiltered source for the input/output to the tnc, and the capacitor
you found may have been a result of a previous owner's attempt at achieving a
flat response via the mic input.

Just a Thought.....

David KD4NUE

> There's some guy in NH that converts HF amps to 6 m -
> Then you will have a kw or so-
>

Contact Carl, km1h@juno.com about this. He trades as RADIOKIT and
says that he has 6M conversions for the Heathkit SB200, 220, 230 and
1000 series, the FL2100, NCL2000, AL80A, L75, L4B, LK450, Bandit
2000A, and others. 603-635-2235 9-9 Eastern Time.

I've no experience of these, I've only read his announcements. I
believe that the conversions result in a single band 6m amp.

If you're wanting a straight key, try the Nye-Viking Master. I have
one of these and I really like it. Its action is quite smooth and
nearly silent, and the contacts are fully enclosed and insulated from
the rest of the key (impossible to get a shock if you're using some
kind of older cathode-keyed rig, and impossible to accidentally
get something across the contacts and key your transmitter). Another
good ol' key that's been around a LONG time is the WW-2 surplus J-38.
I still see these for sale used for $10 to $20, and Fair Radio Sales
sometimes has them new in unopened WW-2 packages for $35.

It matters not that you disagree. Supply and demand WAS accounted for
when I thought to post what I said. I don't buy into that bull that some
hams perpetrate,(namely the "oh, but they're ALL special editions" line
of bull), and THAT's what I mean. If it's an ordinary production piece of
equipment, and it hasn't become any more rare than the next model, then it
depreciates. I don't care who doesn't like it, as the fact remains.
Certainly if it TRUELY is rare AND in mint condition AND highly coveted,
what I said about depreciation does not apply, but I figured that went
without saying.

I am in need of a IC for a Motorola Moxy 150 Mhz radio. I have contacted the Motorola service rep. in my area and I keep getting the runaround each time I speak to them. I have been trying since May of last year to get this IC and usually I hear that "I'm sorry we forgot to order it for you" or "I lost the numbers you gave me". If someone has the ability to order this for me please let me know.

It is the desc. IC with the following numbers on it "M2078" and "274 H 8436". I have tried to cross this to another number but have had no sucess.

Please do not take me wrong I am not bashing Motorola, just tried of not geting the part that I needed.

I suggest that you be careful if you get the tubes from RL Drake.
What they sold me back in 1992 were some foreign made tubes, each of which
had a small circular pc board mounted to the base of the tube envelope.
Apparently, a short-circuit connection was required on these tubes,
perhaps to reduce inter-electrode capacity.

I never did get them to neutralize. My Drake TR4C sits idle now.

Hi Mike,

Many amateurs use both means, depending on what sort of operating they are doing at the moment.

For casual "ragchewing" operations under good conditions, you may prefer the speaker and desk mic arrangement. It allows you to move around the shack, hear other conversations in the room, etc., etc.

The use of headsets may be preferable to you under poor signal conditions, or when the speaker might interfere with other people in the room who are watching TV, etc.

The "boom mic" on the Heil headsets is also handy when you want "hands-free" operation, such as during a contest when you use your hands to log on a keyboard. (Use VOX or a footswitch to key up the transmitter.)

2325. FS: BIRD slugs for sale new and used!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-27 00:00:00 UTC
From: sidener@crunch.nuc.umr.edu
Message-ID: <5cingg$ka6$2@news.cc.umr.edu>
Source record: 184923

Hi, I have a BIRD slugs (New and Used) for sale:

Both for the standard BIRD wttmeters and for the 4410 BIRD

The 4410 is the meter that looks like a Bird 43 but has a range switch
with seven positions. It uses special slugs which are the equivalent of
seven standard Bird slugs.

The slugs are as follows:
NEW:

2 QTY :4410-5 25-80MHz (1, 3, 10, 30, 100, 300, 1000 Watts)
1 QTY: 4410-7 144-520MHz (1, 3, 10, 30, 100, 300, 1000 Watts)
1 QTY: 25W VHF for standard BIRD 43 $40
USED:

1 4410-5 (like above)
1 4410-7 (like above)
1 100W VHF for standard BIRD 43

I am asking $50 each for the New slugs and $40 each for the used ones.

I will also trade even any TWO! of the above slugs for any ONE! of the
following slugs:

4410-8
4410-15 1.2 GHz range

Thanks,

Scott Sidener N0WFL

Seems they are generally considered to be decent
radios, provided you don't want wideband-mod
capabilities.

Used ones around here go around $125. If you are
fortunate enough to be near a very large ham-fest,
check out the RS trailer that's invariably there.
Two years ago they were selling factory-refurbished
2M handhelds out of that trailer for $75.

Who would help me ?

I'm intrested in everything about ACARS
I have found a schematic to build a ACARS interface. I can't test the interface because i don't have the program to decode them.

Who would like to send me decoder software via email ? (something like LOWE)

I'ts above my budget to buy a LOWE interface with the software, if i could test my interface i could affort it.

So to all spotters, radio amateurs... who send me software to decode ACARS (maybe there is schareware to decode them ?)

If you have any other suggestions to help me and it's about the ACAR system, be free to email them.

THANKS VERY MUCH !!!!

Source record: 184934

Hello

I recently bought a FT-50R and so far my biggest compliant, other than some internal generated trash (Same problem as FT-530 only better) is the poor perfromance with the supplied antenna. I hooked up the FT-470 antenna using an adapter and was surprosed at how much better that antenna worked. I'm not about to use this on a normal basis because of concern about the mechanical stability of the BNC/SMA hook-up.

So what's everyone else using. There's got to be something better out there that isalso mechanically stable

Thanks & 73

I have one UHF GP300, 16 channel radio. This is not a P110 in a GP housing, this is a true GP300. It's possible it is a converted 8 channel, but I don't know since I got it with 16 channels. The radio definately transmits in the 483 mhz range, but I am unsure of the exact split. The radio is cosmetically and functionally perfect(I use it for work) I am selling the radio with 2 batteries for $325.00, plus shipping, I'll pay the COD. E-Mail me if you are interested.

Thanx in advance,
Mike

2351. RE: Is the HTX-212 ANY GOOD??????????????????????

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-27 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9701271107097109@atdbbs.com>
Source record: 184949

>>I was wondering if the Radio Shack 2 meter HT is any good. And what's
>>a good price for a used one? 73 Eugene

The Radio Shack HTX-202 is an excellent performer. No, it isn't pretty
to look at. It doesn't receive cell phone calls. And you do not have
5,000 channels...

The HTX-202 has 12 independently-programmable memory channels, plus one
calling and three priority channels. It comes with continuous tone
squelch encode -AND- decode. Power output is 5 watts minimum (7w typical)
with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power
setting provides 1 watt output. A power saver circuit with programmable
1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with
larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the
scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories
store any offset, and any combination of continuous tone frequencies.

Supplied with Nicad battery, charger, 6-cell alkaline battery case,
antenna, wrist strap and belt clip. Features include:

* True FM modulation (not phase modulation) for outstanding
transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are
independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective
paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences
for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with
programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz,
and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or
16 seconds.
* Multi-function scanning lets you scan standard memories,
priority freq. memories, or a frequency range. Resume can be
after 10 seconds, when carrier drops, or remain on channel
(don't resume.)
* Transmit timeout - if you frequently time-out your local
repeater, this circuit will stop transmitting after a preset
delay (30, 60 or 120 sec.) and sound a beep. In effect, it
forces you to reset the repeater before the repeater times out.
Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

From an Owner: "I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!"

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because the HTX-202 is purposely limited in coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end RS could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to MAXON, a Korean entity. MAXON built the HTX-202 for Tandy, under license from Icom. The HTX-202 is sturdy and well constructed.

MISCELLANEOUS NOTES: Some HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

2352. Tech feedback needed for FT-5100 that locked up.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-27 00:00:00 UTC
From: RobertRobinson <psykik@gramercy.ios.com>
Message-ID: <32ED47FD.E89@gramercy.ios.com>
Source record: 184950

I have a Yaesu FT-5100 that I have been using in my mobile for about 4 years. It has the otional tone squelch unit and was wide banded at time of purchase. It has worked flawlessly until a few days ago:

Turning on the radio, the left side of the display showed 300.000 MHz and the other side showed 20.000 MHz (yes, that's 20 MHz). The display was flashing on and off rapidly. There was no volume and I could not get the frequencies to change, although I could shift the two frequencies back and forth from the main band and sub band positions.

The owner's manual says nothing of this scenario. I reset the processor several times and some functions returned, such as the button press confirmation beeps, but the frequencies displayed did not change. Pressing the PTT will display the TX and will show a full scale for full power position and the shortened scale for the low power position, yet there is no discernable RF output.

My thoughts: Perhaps the processor retired rather suddenly or the lithium battery back-up went and this is causing the processor to malfunction.

Any ideas? Should the unit (obviousy out of warranty) need to be serviced, what would be my options (Yaesu, or a local authorized agent, etc?) Is a major expense/turn around to be anticipated?

Thanks to everyone for the help on finding where the lightbulb was for
my analog meters (the bulb is mounted inside the meter assembly!) I
just got through picking myself off the floor after I kicked myself for
not realizing where they (Yaesu) hid the lightbulbs!
I guess I just got used to the simple designs of Heathkit and the ease
of changing out a lightbulb! Thanks again for all the help! Alan

On the RF deck of the 79 (the back), there is a small board installed in the center. Lift that board up and you will see a group of solder points with no parts installed located on the mainboard below. That is where they belong.

I personaly would not attempt to install such tiny parts in a radio that small, but I imagine it can be done.

Rob Neff (N7ORY)

The Golden Years

by Hugh Cassidy, WA6AUD

(Originally published in the West Coast DX Bulletin, 2 March 1976)

One of our more recent QRPers came by last week and he had a question. "Why are the older DXers always sitting around and talking about the good old days?", he asked. "Were things really all that good and were they really the Big Guns that they say they were?"

We have often been troubled by this question ourselves so we hauled the QRPer over to the Old Timer who listened to the question. " A man must preserve his self-esteem", the Old Timer said, "and some may tend to rewrite the remembrance of other days and older years. The years that are gone will always be the golden years. It comes to most everyone."

Son of a Gun! You would have thought that the QRPer had all the answers he needed but he persisted. "But did all those things really happen? Are the things they say true?" And the QRPer waited for his answer until the Old Timer spoke again. "It may not be but they believe. And what does it matter?"

And we had to leave it there for nostalgia is the warmth of the old ones and the years will bring to everyone eventually the recollection of the good old days that were, and a thought of some things that might have been but never were. And always somewhere there will be someone whistling "Roses are Blooming in Picardy." And always next year will be the Big DX Year and the dreams of DX will come your way! DX IS!

Took this filter out of the drawer the other day and while inserting the phono plug into the phone jack on my receiver got sparks, blew a circuit breaker in the house and let some of the smoke out of the case. It doesn't work any more.
I don't even want to open the case until I have some idea of what I'm looking for. I'm good in any recent callbook or respond by e-mail. I'll pay for postage and copying.
Thanks,
Ralph, N1LAH

2385. Spearker and mic vs. Heil headset...

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-27 00:00:00 UTC
From: badger@vbe.com
Message-ID: <5cgvqr$4nc@news.vbe.com>

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I need some advice from knowing sages.... Having recently purchased my first radio I now must find the accessory equipment for it. My search is about ended (for now <grin>) except for the following.....

What are the advantages and disadvantages to having a remote speaker and desk mic vs. a setup like the Heil headsets ???? Are their disadvantages to either ??

Thanks

Mike Melland

Do you care to divulge the 8 secret components???

I have looked mine over and am not sure how long it would take me to find 8 missing parts considering the small size of the architecture.

I'l try to help you, i have a TH79 and in the shop where a buy it the
modifi it to receive 800-999mHz
I have the original Kenwood mod's papers for the TH79, i could scan them
and send them to you in JPG format.
Just give me a mail if you want it. I'm also looking for software to
decode ACARS, those software is deliverd with the LOWE airmaster.

2392. Re: ICOM 706 - Tuner Mods ????

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: faunt@netcom23.netcom.com
Message-ID: <FAUNT.97Jan28135329@netcom23.netcom.com>
Source record: 184793

There have been a couple of questions recently about the 4 pin tuner connection on the IC706, so I did some digging through the schematic.

There are 4 pins, from the pointy end they are called TKEY, TSTR, 13.8 and GND. The last two are obvious.

TKEY, also called KEY, is the same as pin 9 of the ACC connector, and goes through some protection to pin 16 (P94) of the CPU, where it's called an "input port for the keying signal of the AT-180 and AH-3 tuners."
In the AT-180 schematic, this signal is driven by an open collector from the CPU in the tuner.

TSTR, the same as pin 4 of the ACC connector where it's called BDT, is rather more complicated. It's an input to the CPU on pin 17 (P93) where it's called "input port for the optional AH-3 antenna tuner". It's driven by an open-collector from pin 21 of the CPU, called "ATST, Outputs start signal for the optional AT-180 antenna tuner" anded with D0 from the A/D, IC35.

In the AT-180, it's called BDT or ISTA and it goes to a transistor input, with a 1K pullup to +5, with a waveform shown on two pulses from 4.4V to 0V, about 3 to 1 ratio and a notation that says "10MHz" It looks like the signal ends up at the AT-180 CPU on pin 15 (function information not given for the AT-180 CPU).

It was an interesting thing to do.

What about a mod to keep it from following the keying. That bothered me.
I would tap the key and the fan instantly sped up as if connected to the
key! 73

Hi Tracy,
We manufacture a patented line of intermod filters for 2 and 70 cM. They are very effective. However, with that said, I do not recall selling a single filter for RS rigs (this is out of thousands!). Now, many of our sales are through dealers so I may have missed something, but I would think it might be worth your while to have the front end looked at.

I have two IC2SAT's and have the same problem. It is less with the
higher voltage batteries but still there. I replaced the LCD thinking
it was defective and still the same. I think it is the display voltage
that drive the LCD that is the problem but do not know how to fix it.

carl, i use an optoelectronics frq meter with my swan 270. i built a pass-thru box. an aluminum box with coax connectors on either end hooked together with coax. at right angle to coax i placed a bnc connector and placed a single loop of insulated 14 ga wire over the coas but under the shield (tricky, but not hard). the loop /bnc feeds the counter and the antenna feedline goes to one end of the coax connection and the other to the tx. works reat for me. plans were in qst a couple of years ago, but dont recall which one. gl and 73 evan ke4bwd

Hey,
The FT50 is truely a great radio. I am an Auxiliary Firefighter, and we pretty much buy our own equipment. I had a Motorola HT1000, but I needed some money and sold it....used the money I needed and bought an FT 50 with the rest. The radio has been thoroughly soaked, dropped from 50 feet onto cement, used at numerous fire and accident scenes without any problem. The radios are so popular down here that 7 other FF's and Explorers went out and bought them also.We use the in both UHF and VHF mode. The only thing I would really like to see in this radio besides channel banks is a priority channel. Otherwise, I would take this over the HT 1000 any day, and tricke dout with the keypad and Mic it is still about half of what a Motorola would run you. Tom

Patrick,

You didn't say what kind of stereo you have, but some of the designs use a feedback circuit to amplify the bass, these often times act just like a detector, and feedback the rectified RF into the finals at full power. Try putting bypass capacitors and torroid cores on your speaker wires right at the amp.

Good Luck, this is a tough one to get clean sometimes

Considering that both Texas Star and Palomar manufactured
illegal CB amps, it's not likely that you'll find an address.

Most of their amps were based on information in the Motorola RF
application notes. This may be your only source
for documentation or technical support.

Try this:

Motorola Literature Distribution
P.O. Box 5405
Denver, Colorado 80217
1 (800) 441-2447
1 (303) 675-2140

Message-ID: <32EE6069.7096@psl.nmsu.edu>
Source record: 184815

I have a friend who has one of these radios. He is getting all kinds of intermod, from police (155.19 coming over 146.64) to taxi services. Is this normal for this radio? I hope that there is a problem with the radio rather than a poor design. He is a new ham, and I feel kind of bad because I helped him pick it out!

PS We bought it used, so we cant return it to RS (I wish I could !!!)

Tracy

Hi Danko:

The document you are after carries the following Kenwood part number:
B51-8158-00(O)997. It is available from Kenwood Parts --- or at least
it used to be. Some Kenwood dealers may also have an available copy.
It's possible that supplies may now be exhausted. The price on this
document used to be $45 U.S.

Are you experiencing some particular problem? If so, I might be able to
assist you.

Regards,
Keith

> N9MQY

Chris,

I have an ICOM 735 with transverter I/O connections. I also have the
Ten-Tec 1208 6 meter tansverter that I built from the kit. It works well
and does not require nor make use of the transverter connection on the
735. It will work with any 20 meter HF rig whose RF power output can be
adjusted to 5 watts. It will work with up to 10 watts input if some
resistors are changed.

If you require a transverter that that makes use of the transverter I/O
connections on your radio then contact a company called "Down East
Microwave", RR1 Box 2310, Troy ME 04987. 207-948-3741.

Good Luck,

Brien

This is typical of internal tuners. My TS-940s did the same thing when trying to load a 160 dipole. The problems is due to high currents circulating through the little torriod coils in the tuner when trying to match a low impedance. My dipole had an impedance of around 15 ohms at the frequency I was trying to match. As the coil headed up, the inductance of the coil would change which resulted in what appeared to be a higher swr. Eventually the torroid burned out.

Your problems is simply that you are trying to match an "out of range" impedance. The cure would be to either change the length of the antenna or the feed line. Try adding about 10 or 20ft to your feeder and see if that helps. Doing this will cause the current point to appear elsewhere other than at the rig and make matching easier.

2418. TS-950SDX opinions wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: mccarths@lcm.macomb.lib.mi.us
Message-ID: <5clplo$n3c$1@news.tln.lib.mi.us>
Source record: 184819

Thinking about a TS-950SDX, but I don't hear alot about them, good or bad.
Anyone wish to share their experience with the rig?

I'd be using the rig for DXing (cw), a little single/single contesting
(cw/ssb), and alot of phone on the low bands.

Plan on running it into a pair of 3-500's until something
low-drive/legal-limit pops up.

Thanks,
Sean

I stuffed this gear into the trailer today to take to Foothill Saturday and
Livermore, Sunday. The prices are plus shipping if need be.

WRL CLOBE LA-1 Linear Ampl. uses (4) EL38/6CN6ï¿½s. 80-6m
It is original and complete. Looks fair, about a 6 or 7. Untested.
$85
EICO 753 Transceiver with the matching PS. Works, but could be more
sensitive on reception. SSB/AM/CW. 80/40/20M An 8 or 9 in
appearance $135
VIKING II, this is untested. Has no tubes in it. The guy I traded this from.
whom I do know, says it works. The appearance is a 5 -6.. The
face looks fair to good. Has all the knobs, etc. There
are some small blemishes on the face. $100 with the understanding
that the power and modulation transformers shall be good. This
is UPU or for delivery at the meets this weekend.
VIKING 122 VFO. Likewise, I have not tested this, but the same guy says
it works. It looks good. A ï¿½9ï¿½ with a very narrow scratch on the face.
$55.
HALLICRAFTERS HT-37. Untested. Has spot of paint gone from the top.
The face looks OK. It looks complete. Face is original, knobs and all.
$95. UPU or delivery this weekend at the meets.

2423. Re: TS-570D tuner quirks

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: Phil Wheeler <w7ox@ix.netcom.com>
Message-ID: <32EEFA4F.26E2@ix.netcom.com>
Source record: 184824

Not too surprising.

An 80 meter dipole is not much of a match except on 80 meters.

I have a TS570D and the tuner works great with my G5RV and my vertical
-- no sweat. In fact, the tuner in my old TS-440SAT did a lot of
"grinding" (aka mechanical stuff) before settling in wiht the G5RV

I'm very happy with the TS-570D in all respects: An outstanding HF
radio, including the antenna tuner.

BTW -- most antenna tuners are speced to work at SWR of no higher thaaan
3:1 -- but most will outdo their spec values.

Regardless of whether the microphones are compatible, I would suggest
you avoid the MFJ mics--I have one for my Kenwood TH-79 and have had
nothing but problems with it. I recently got a Kenwood mic which was
rather expensive but worth it. You should definitely consider a Yaesu
mic.

>this?

For serious car-to-car-type communications, you might want to consider
the GMRS. These FRS units are virtually worthless for any serious work.
One-half watt...fixed antenna...and, as of now (as you see) quite
over-priced.

Whereas Maxon makes the 210+3 for $160-180...with CTCSS capability, and
a full five watts when used on 12VDC. A no-test, $60.00 license covers
all family members residing in the same household for five years.

Here is a list of the stuff that I will have for sale at the Charlotte Hamfest. If you want to get an advance
look at it or buy it before the hamfest give me a call. Better yet send your phone number over E Mail and I
will give you a call.

1. Collins Thirty S-One amplifier. 100 watts in produces 1300 watts out. Uses 4CX-1000 tube. In like new
condition with manual. $975 - very firm

2. Complete B&W slow scan setup. Robot 400 slow scan, Sanyo monitor and RCA camera. All of it like new with
manual. $275

3. Kenwood TS711-A all mode 2 meter transciever. Memories, SSB, funky offsets, this unit has it all. Just
like new with manual. $525 - don't even ask

4. Go into business with your own computer to program cellular phones. Loader phone, computer with software
installed and operating, cables for motorola bagphones and installed phones, diagrams to make cables for all
other motorola phones up to software version 95xx. This setup really does work, and I will give instruction in
how to use it. You can get your money back in one saturday at the flea market.
$850

5. CD ROM drive with interface card and sorftware. Works perfectly
$25

6. Star printer. Works perfectly, missing one piece of plastic.
$25

7. Okidata microline printer. Works great.
$10

8. Calcomp plotter, "E" size. Hangs on serial port, works perfectly. With manual (which cost me $130) and
serial connection. Emulates HP plotter. $200

9. IBM Selectric typewriter. Works fine, great for filling in forms.
$25

10. Modems - 1200 baud and 2400 baud. One US Robotics and One Hayes internal.
$10 each

11. Orchid Videola Premium Plus. Complete and working fine. Video capture and playback on you PC.
$175

12. PK-323 MBX. Just like new.
$175

> (callsign STILL pending, after 2 weeks!)
> <yellenic@epix.net>

I did some CB conversion when I was in high school before
and it was fun. Maybe I can share that experience with
you.

The first key is to find the right crystal(s). For it will
change the local osillator frequency. I remember mine was
using 27.125MHz (ch. 14) and I changed it to 28.??? and
"Bingo!".... You have just made a CB into a 10M rig.

But you only have 23 (or even 40) channels to work with.

The second key to a successful mod to a CB is to learn the
Phase Locked Loop (PLL) IC's encoding pattern. You can get
the TTL pattern from the contact points of the main dial.
By changing the TTL pattern, you'll get more channels or
even the channels in between 2 channels (ch. 14 and ch. 15
have a wider gap or so, if I still remember it right). A
frequency counter or a seperate receiver will help. There
are also books about PLL IC's. That will also be a fruitful
resource if your CB's PLL chip is listed. In this case,
you don't have to figure out the TTL pattern by trial and
error. If your PLL chip is an 8 bit chip, you can have up
to 256 channels! If your PLL IC is of 10KHz resolution,
this means your rig can have 256*10KHz = 2560KHz = 2.56MHz
coverage! Good enough for the entire 10M band. You can
build a box with ON/OFF switches that resembles an external
VFO (or channel selector).

The last part (I am always afraid of this) is to retune the
radio. After up'ing the LO frequency, your radio might not
resonance anymore. All I did was to turn the coils and

capacitors until I see maximum power came thru my meter (AM mode). More knowlegable HAM's will know how or what impact will do to the radio reagarding to tuning coils and caps. Watch out for the modulation VR(s). Over modulation will generate spurious emmision.

I made an external box that had 2 rows of switches (8 on each row) that acted as 2 seperate VFO's. A switch on the box to select the operating VFO (A & B). Hehehe.. You can make as many VFO's (memory channels if you so want to name it) as you want... Later I put a small relay inside the box and another switch for duplex operation. 10M has many repeaters, too!

Not bad for a cheap 10M rig like that. Features all mode operation (AM, FM, SSB), dual (or multiple) VFO's, 10KHz tuning, and duplex operation. However, you'll need to make yourself a chart of switch ON/OFF positions for QSY purpose. Otherwise, you will have to count on your frequency counter.

Good luck and have fun!

You're basically SOL. Unless a public service agency complains, too
bad. Remember, amateur is a secondary user of all freq's they are on.
Unless they are causing interference to another public service agency,
tough. Remember, the sensativity on a amateur rig or scanner is
nothing compared to a commercial rig. Putting my BC9000 next to my
Icom U-400 (16 channel mobile) is no comparison, even putting the PL
in my 9000 and no PL on the Icom. Yes, same antenna.

There never was a service manual for the IC-505 published by ICOM, Inc.
The techs at ICOM America use just good old radio knowledge to fix that
radio. The likely best tech on the IC-505 is Malcom technical Support at
509-732-8883.

Source record: 184841

Have a Yaesu 2070 dual band commercial HT (willdo amateur.) 32
channels, rapid charger, program kit & cable, software, manual, etc.
Radio does 136-174/440-470. Can be modded to do 470-490 or any split
by factory. $650/bo cash. Please reply asap, no reasonable offer
refused.
Radio is in great condition, has a DTMF keypad, PL decode/encode and 2
tone decode board.
Must sell ASAP, $650/best offer. Feel free to e-mail your best offer
or call anytime, 415-939-1037!
This radio is worth over $700 with program kit, rapid charger, etc:

Yaesu 2070 dual band - Brand new:
Comes with: 5 Watt battery, 1-hour rapid charger, DTMF keypad encoder,
Two-tone sequential decoder (Motorola 1,2,3),Tone Burst board, Belt
clip, Programming Software/Cable/Manual.. Worth over $2,000 brand new.
See
http://maverickcomm.com/vertex/fth2070.html
for a current price.
Will consider trade for:
Icom F40 450-500 split
Motorola JT-1000
Bendix 210 UHF.
or other UHF 440-490 UHF HT with DPL capabilites & Alpha.

Message-ID: <5ck71ngco1@ramp2.tir.com>
Source record: 184843

Hello all;

I've just purchased a TS-520, and of course, it did not come with a manual. I'm wondering if any of you nostalgics out there, could help me with the preliminary tuning functions needed, to get it on the air. I don't have a lot of expierience with HF rigs, just the HW-101, and the TR-4C.

Also, anyone know where I can purchase a manual for the 520, at a reasonable price?

Tnx

2437. Re: New "family channel" radios -What's up with that? -FAQ attached

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: Joe <joentam@transend.com.tw>
Message-ID: <32EE9B42.5C11@transend.com.tw>
Source record: 184844

Hi Don,
Found this on the web and saved it off since it looked interesting.
Dont recall the source...sorry:

Regards, Joe

---

1. What is the Family Radio Service (FRS)?

FRS is a private, two-way, very short-distance voice communications service for facilitating family and group activities [95.401(b)].

2. Where did FRS come from?

The FRS culminates more than 20 years of attempts by FCC and industry to establish a new unlicensed personal radio service: the Class E CB and Personal Emergency Locator Transmitter services at 220 MHz, the Personal Radio Communications Service (PRCS) at 900 MHz, the GMRS adjunct at 902 MHz, and the Consumer Radio Service (CRS) at 460 MHz. None of those services were ever approved by the FCC in the end.

Tandy Corporation's Radio Shack division proposed FRS to the FCC in 1994. After heavy opposition from current spectrum users and strong support by radio manufacturers, the FCC authorized FRS May 15, 1996.

3. Is FRS "UHF CB"?

FRS is the only "UHF CB" in the United States.

FRS is one of three Citizens Band Radio Services. The others are the Citizens Band Radio Service at 27 MHz and the Low Power Radio Service (LPRS) at 216-217 MHz.

The General Mobile Radio Service (GMRS) is sometimes described as "the old UHF CB". That description has no legal or historical basis in fact. GMRS was formerly named Class A Citizens Radio, never Citizens Band.

LPRS, though a form of CB, only allows certain limited uses including theft tracking, auditory and health care assistance devices and control stations in maritime radio. No two-way voice communications are permitted in LPRS.

4. What are the FRS channels?

Channel (MHz)

1. 462.5625
2. 462.5875
3. 462.6125
4. 462.6375
5. 462.6625
6. 462.6875
7. 462.7125
8. 467.5625
9. 467.5875
10. 467.6125
11. 467.6375
12. 467.6625
13. 467.6875
14. 467.7125

5. Do I need a license to operate an FRS unit?

No license will be issued. You are already allowed to operate an FRS unit if you are not a representative of a foreign government, and if your authority to operate an FRS unit has not been withdrawn by the FCC, and if you comply with all FRS rules in Part 95, Subpart B-Family Radio Service (FRS).

6. Is my FRS radio an unlicensed Part 15 "intentional radiator" like a cordless phone?

No. It is a radio station in the Citizens Band Radio Service, "authorized by rule" under the Communications Act.

Unlike Part 15 intentional radiators, FRS users are subject to operator rules.

FRS manufacturers are subject to FRS technical standards found in Part 95.

7. May I use my FRS radio for business communications?

"Small businesses...may be users of this service in their business activities." (FCC Report and Order, WT Docket No. 95-102, at 20(D).

8. May I use my FRS radio to communicate with a station in the General Mobile Radio Service (GMRS)?

We interpret the GMRS and FRS rules to permit GMRS-FRS intercommunication. Others do not. The FCC has not issued any formal rule interpretations on the subject. We consider it unlikely that the FCC would take issue with GMRS and FRS users talking to each other.

(No one, however, may transmit using anything but a FCC-certified FRS radio on the 467 MHz FRS channels 8 through 14. Because those are the only channels on which current FRS radios operate, it is

physically impossible for a GMRS licensee to lawfully use a
GMRS radio to talk with a FRS user.

In public comments filed with the FCC, it was demonstrated that the 467
MHz FRS channels were entirely unnecessary. Indeed, to
this day no one has proffered any justification for one, much less
seven, 467 MHz channels to be allocated to FRS.)

You may not use your FRS radio to communicate through GMRS repeaters, or
on any of the GMRS primary channels, or any
channels not already built into your FCC-certified FRS radio.

9. Must I identify my FRS station or transmissions?

The FCC does not require you to identify your station or transmissions.

10. May I set my FRS radios up as a repeater station?

The FRS Rules do not expressly bar FRS repeaters.

You would have to set your radios up as a repeater station without
connecting anything to the FRS radio that was not FCC-certified
as part of the radio. Methods of accomplishing this aim were disclosed
in the record of the FRS proceeding.

Repeater controllers, external receivers etc. are unlikely to be
FCC-certified as part of the FRS radio and so could not be
connected to it.

11. May I connect an external antenna or power amplifier to my FRS
radio?

You may not attach any antenna, power amplifier, or other apparatus to
an FRS unit that has not been FCC certified as part of that
FRS unit [95.194(c)].

A FRS antenna must be an "integral part of the transmitter" and have no
gain as compared to a half-wave dipole [95.645].

12. May I connect my FRS radio to the telephone?

No FRS unit may be interconnected to the public switched [telephone]
network [95.193(c)].

13. May I broadcast music over my FRS radio?

You may only use FRS to conduct two-way voice communications with
another person [95.193(a)]. Only these types of one-way
communications are permitted [95.193(a)]:

* To establish communications with another person (to call them);

* To send an emergency message. The FCC defines an "emergency message"
as "concerning the immediate protection of property
or the safety of someone's life";

* To provide "traveler assistance":

* To make a voice page;

* To conduct a brief test.

14. May I use my FRS radio to transmit one-way paging messages?

Yes, but only voice paging messages [95.193(a)]. You may not transmit "tone-only" pages (a tone-only page consists of tones communicated in order to find, summon or notify someone).

15. May I use my FRS radio to transmit data communications?

Not exactly. The FRS radio may only transmit tones to make contact or continue voice communications with a particular FRS unit. [95.193(b)]. Hooking up, for example, a packet radio controller (TNC) to a FRS radio would be strictly forbidden even if easy to do.

16. May I operate my FRS radio anywhere?

You may operate your FRS radio in the United States and certain locations specified by the FCC [95.192].

If you want to use FRS aboard a vessel or aircraft owned or operated by a U.S. citizen or company, you will need permission from the captain (see 95.192(a)(1)).

However, the captain may not have authority to give you permission (for example, if FAA regulations forbid it).

17. May I transmit continuously over my FRS radio?

You may transmit only as long as you are conducting two-way voice communications with another person or transmitting lawful one-way communications as listed in question 13. Use of FRS transmissions to "monitor" anyone or anything, as that word is normally used in radio (one-way transmission) is not allowed.

18. Must I listen to the FRS channel before I transmit?

You must share the channel with other users [95.191(b)].

There is no meaningful way to share the channel with others unless you listen before transmitting and wait until the channel is available before you transmit.

To listen to the channel, you must disable any tone squelch or other feature that can keep you from hearing other users.

Also, you must at all times and on all FRS channels, give priority to emergency messages [95.193(d)].

You would not be able to do this if you didn't listen for emergency messages.

19. Doesn't my radio monitor the channel before transmitting?

The FCC does not require that radios do this by themselves. No FRS unit available for sale includes this feature.

20. How much does a FRS radio cost?

The typical price is $100-200.

21. When can I get FRS radios?

The radios are available from major mail order radio dealers.

Hello Everybody ,
Many thanks expecially for the nice guys who suggested me some possible
ways to modify my ts440s (Don KA9QJG, John N0EE).

Talking with a local kenwood reseller I was suggested of a very effective
power modification for obtaining variable power from the TS440sat.

Just cut the D49 diode on the IF board (upper cover) and so the carrier
Control works on SSB too (2W -> full power).

best 73 Andrea Ik5qlo (excuse my so so english)

Well you need to put the capacitors back because you removed the pre
emphasis. You just had low deviation and need to juice up the audio
path gain. The 726/736 mike path seems real stiff anyway.

Good Luck,

Bill Harwood, W5WH

2442. ic706 fan mod!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: bfurno@iacom.com.au
Message-ID: <32edcce3.12401232@news.iacom.com.au>
Source record: 184849

If you hate the constant sound of the fan running while just listening on you 706 then you should try this simple mod!!

On the PA unit locate R65 47ohm next to the J1 coax plug on the left edge of the board near the fan wire plug remove it "requires a bit of heat and a small screwdriver to pry it of the board" and replace it with 100ohm half watt. lower values will make fan run faster but more noise you can try different values to find one that gives the air flow you want and the noise level you are comfortable with. this mod does not effect the hf tx fan speed or operation just the fan speed when in rx

Amazing what small improvments you can make when you finally get a service manual

: good ol' key that's been around a LONG time is the WW-2 surplus J-38.
: I still see these for sale used for $10 to $20, and Fair Radio Sales
: sometimes has them new in unopened WW-2 packages for $35.

I too have a Nye-Viking Master key, and also like it. But I've found two small problems with it: the feet wear off fairly easily, and the adjustments quickly loosen when used mobile. Putting #6 internal-star lock washers under the various nuts will hold them in place under mobile vibration.

While the J-38 is a good key, I also like the surplus J-37 key which is also very common. It has a black phenolic base and a heavier arm than the J-38. Also, the J-37 is somewhat noisier, which is actually an advantage if you're using an older rig without a sidetone, like my Atlas 210. (In my experience, the "clicks" and "clunks" of a noisy straight key wil be a useable subsitute for a sidetone.)

The J-37 and J-38 keys are usually found with the small flat knob, which I hate. Nye sells a nice plastic "Navy" knob which is both larger and has a large flange beneath the upper knob, and I find it much easier to send with. The Nye Navy knob will fit on both the J-37 and J-38 keys.

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Hello,

I am serious thinking about trying RTTY. Until now I don't have any
experience with this mode. Mainly I am interested in DX on the HF bands
and use a IC-736, a 500W linear, beams: 20/15/10m, 30/17/12m and a
Pentium 90 PC. I am interested to run RTTY for DX and a few Contests,
if possible.

I would like to use some good hard- and software; it must not be the
cheapest solution. :->)

Here are my questions to the gurus:

1. Which hardware and software you would recommend for RTTY?
2. Do you know any online document, like a FAQ, which I should read?
3. Do you have any further advices, hints, etc. for me?

Many thanks for your help in advance ..

2454. TS-570D tuner quirks

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: hopewell@ctg.net
Message-ID: <854461117.6993@dejanews.com>
Source record: 184861

Hello again!

I'm the proud owner of a new Kenwood TS-570D, and I love the radio. However, the internal antenna tuner has a quirk that other owners may want to watch out for!

As I was unpacking my new TS-570D, a little slip of paper fell out of the packing along with the owner's manual. It said (I'm not quoting exactly, but this is close): "Caution: Before using the internal antenna tuner, check to be sure that the SWR of the antenna system is below 3:1. If it is not, adjust the antenna system so that it is below 3:1 before attempting to use the internal antenna tuner. Failure to do so may result in damage to the transceiver and/or antenna."

I glanced at this slip, wondered about it for a minute and continued unpacking. I plugged my halfwave 80 meter dipole into the ANT 1 port and started operating.

The antenna tuner found a match on all bands, and I was impressed. However, I noticed after operating for a while on 40 meters the other day that even though it found a 1:1 match at first, after 10 seconds of CW, the SWR climbed to 1.2:1, then a few seconds later to 1.5:1. I stopped transmitting when I saw the SWR hit 1.5:1, so I don't know if it would have kept climbing or not. I noticed it doing the same thing on 30 meters, again with my 80 meter dipole. Since the rig's meter shows SWR and RF output simultaneously, I was able to notice that the power output started to drop as the SWR started to climb. I immediately unkeyed, of course! I hit the AT TUNE button again after this happened and it went off in search of another match! It found a 1:1 match each time, only to "lose" it once transmission commenced. (The antenna's cut for 3.700 MHz, and across 80 meters, I keyed down for extended periods with no SWR fluctuation, and testing revealed that the SWR stayed steady on the other bands.)

Then I remembered that little slip of paper. I switched the auto tuner off, cranked the RF back to 5 watts and checked the antenna's SWR directly. Sure enough, on 40 and 30, the meter showed an SWR above 3:1. On the other bands it was either right at 3:1 or lower.

I'm kind of stupid when it comes to SWR, feedline radiation, etc. RF is a mysterious entity to me. Can anyone explain to me what's going on and why the SWR would slowly climb during a transmission?

I always thought that once a tuner found a match, the match was good as long as the condition of the antenna and feedline remained constant. I also thought that whatever SWR existed in the first few seconds of RF output wouldn't change over the course of time.

(The same thing happens with the rig's earth ground lead connected and disconnected.)

Of course, I know that trying to tune one dipole on all bands isn't the smartest thing to do, *especially* with an internal auto tuner, when your goal is really low SWR on all bands. (I'm not *that* stupid.) But I live in a townhouse and additional antennas are out of the question. I have a birthday approaching, and I've asked my wife for an MFJ-949E!

(I'd be interested in hearing if any other TS-570D owners have experienced this.)

73,

Meade

2459. The MFJ 941E Tuner: meter readings?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: Larry Gagnon <lgg@ampolexusa.com>
Message-ID: <01bc0d2c$2e154800$75a9f7ce@lgg>
Source record: 184866

On my MFJ 941E 300wt antenna tuner there appears to be a real inconsistency between the front panel power switch button, the manual and the scale on the wattmeter. The former two (button and manual) say that the full forward power meter scale is either 300 or 30 watts, depending on whether the power switch is set at 300 or 30 wts.

However, the scale on the meter itself says that the full scale forward power on Low setting is 6 watts! Also at the bottom right of the meter the small print says that low power readings are x1, which means it porbably should be 6 watts. This is a great discrepency and I don't have a second meter to test which is correct

Does anyone out there know which is the correct reading: 1) the meter scale as is or 2) the meter x5 to give 30 watts??

I would really appreciate any enlightening responses! Thanks

Larry VE6TN/W0

I would like to know of any facility that can handle repair of a FT1000d radio, other than Yaesu USA in Cerritos, Calif.

Also, can anyone tell me the flat rate for repair of a FT1000d by Cerritos? and of their experiences with radio repair by the Factory Techs ?

2464. Re: FT-50 TECHNICAL QUESTION

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: timh@xetron.com
Message-ID: <E4pz3H.38H@xetron.com>
Source record: 184871

HSSQ is Squelch Hysteresis.
THSQ is Squelch Threshold.
TISQ is Squelch Tight.
No internal attenuator
The settings that I used for these are as follows:
VHF UHF (use VFO to toggle)
HSSQ 0 uHSSQ 0
THSQ 134 uTHSQ 130
TISQ 85 uTISQ 91 Current VHF
S1LV 112 uS1LV 126 S1=-116dBm
S9LV 207 uS9LV 222 S9= -93dBm
HIPO 170 uHIPO 128
L3PO 109 uL3PO 92
L2PO 62 uL2PO 51
L1PO 18 uL1PO 15

Probably adjusting each parameter to the above settings should yield:(for VHF)
a squelch threshold of about -123dBm, S1 (S1LV)=-116dBm, S9 (S9LV)=-93dBm, Squelch
tight=-98dBm
High power (HIPO)=5.02W, Level 3 Power (L3PO)= 2.50W, Level 2 Power (L2PO)=1.02W
Level 1 Power (L1PO)= 0.101W

In article <01bc0bc3$e4a6dbc0$187174cf@default>, ACABAMS@WORLDNET.ATT.NET says...
>
>The internal adjustments on the FT-50; HSSQ,THSQ,TISQ, what are they for
>and can I adjust them to optimize something?
>
>Does the FT-50 have a built in attenuator function?
>

BTW... before I get hate-mail on that last message I just wrote on this thread, the mod I was refering to leaves the radio incapable of getting any NON-ham frequencies* and DOES include an alignement procedure to reduce avoid producing undesirable characteristics like splatter.

I thought I should mak it know that I refuse to advise or help anyone to transmit on illegal out-of-band frequencies.

To curtail abuse, I won't post the how-to details in a public newsgroup.

*The finished-mod coverage,(in 4 bands with clarifier at TDC), is:

A: 28.30 to 28.44
B: 28.44 to 28.88
C: 28.93 to 29.08
D: 28.08 to 29.52

Since the frequencies from 28.00-28.30 are for CW and 29.51-29.67 are for FM repeaters anyway, which are 2 modes that the radio in question doesn't have, there's no big deal about coverege not going any lower or higher.

2472. FS: Motorola VHF repeater/radio

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: Rod Davis <kc4neq@magicnet.net>
Message-ID: <32EE2706.2D34@magicnet.net>
Source record: 184879

I have a Motorola VHF mobile radio that has been converted to repeater operation by Versatel in Casper, Wy. I was planned to be use by our disaster prepardness group. Between its order and arrival we recieved a donation of Motorola UHF repeaters and have decided to move to that band.

This unit transmits 40 watts and the squelch opens at .1uV. It cost $275 plus $79 each for the channel elements. I have removed and will retain the channel elements.

Asking $150 plus shipping.

Rod

2473. What the Heck do you think of this?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: Patrick Tatro <patrick_tatro@stortek.com>
Message-ID: <32EE45D4.47DF@stortek.com>
Source record: 184880

What do you think of this?

When transmitting on 160 meters using 250 watts of power,
I am blowing the 3 Amp power fuse in a stereo in another part
of the house. (yes the stereo is on at the time) This has happened
three times now with different antennas. I wrapped the power cord
around a ferrite core but it didnï¿½t help.

Any suggestions?

I've got an Optoelectronics Scout for sale. It's a scout model 25 with a frequency range of 10Mhz-2.8Ghz. It requires a CBAR interface to interface to the AR8000 and 2700, and I have and will provide this also. It's in good shape and works well, I had it recalibrated and cleaned at the end of October 96.

I'm asking $300 for the Scout and CBAR Interface, please e-mail me at mwaldron@ohio.net.

From: Larry Gagnon <lgg@ampolexusa.com>
Message-ID: <01bc0d35$4dc95840$75a9f7ce@lgg>
Source record: 184882

I have an IC-735 with the keyer unit installed. The speed adjustment uses the slider pot for the mic gain. This logarithmic pot is very difficult to use and adjusting between 15 wpm and 35 wpm is very difficult. Does anyone know of a modification for this problem? I contacted Icom and they could not help.

I would appreciate hearing from anyone with experience in this regard.

73's and thanks...Larry VE6TN/W0

2479. Kenwood TH79A 800mhz mod?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-28 00:00:00 UTC
From: akent@bga.com
Message-ID: <5cla57$c9g@news3.realtime.net>
Source record: 184886

Earlier, a fellow named Mike had a message here about the magic 8 parts that would allow the TH79A to receive 800-999mhz.

Has anyone found the parts and positions for these?

I disassembled my radio, and found an area under the X57 RF daughtercard that contains an area with no parts. The problem is that I don't have a parts placement diagram, and so don't know where the added parts go. I can't see the magic number of 8 missing parts on the schematic either. I see a few transistors with (o) next to them (I guess these mean optional), but I only count 4 of these. If you look at the parts with an asterick, I count 30 some odd. All of these are in the area of the 800mhz block on the schematic.

I am very interested in this mod.

Please help.

BTW: This radio is incredible small inside. I am really impressed at the internal design.

Well actually no, even the schematic in the manual had it with the 0.15
ufd capacitor, it is in series with a 330 ohm resistor and across a 10K
emitter resistor. at 300 Hz a .15 ufd reactance is about 5 Kohms, By old
rule of thumb it should have less than 1 K reactance..So it was not a
modification, but I do not know why it became a problem suddenly..

From: dddavis@atl.mindspring.com
Message-ID: <5ck05l$kdv@camel2.mindspring.com>
Source record: 184980

I think the Comet SMA-3 is about the best I have tried, but I also
really like the Diamond SRH519 because it is very thin and flexible.
My only complaint with either is that the housing of the radio is
designed to allow the stock antenna "shroud" to fit inside and seal.
The after-market antennas do not since they would have to be
specifically designed for this radio. Do not bother with the Comet
SMA-501 unless you are standing near the repeater antenna.

Date: 1997-01-28 00:00:00 UTC
From: dddavis@atl.mindspring.com
Message-ID: <5ck0f0$kdv@camel2.mindspring.com>
Source record: 184981

I recently saw an ad from Radio Shack for some little no-license HT's on something called the "family " frequency. They were over-priced I'm sure, but I have sometimes thought it would be handy to have something like that to hand to non-licensed family members for car-to-car communications and such on trips. Anybody have more particulars on this?

I suppose I could just go to Radio Shack and ask this. After all, "You have questions; they have answers." :)

regards, Don (KE4KYO)

Why do EDU forbid forsale? Maybe it's not the EDU site, but the admin,
the owner of the list, who knows. But I'm sure there's a reason. The
list may be free to the listowner with a rule that no money be
transacted over it (for sale/WTB).
It could be the list owner just doesn't want it.
It could be that a list that allows for sale would be flooded with FS
posts more than anything, resulting in a drop of subscribers.
But whatever the reason, I'm sure there IS a reason.
Would you like to stop complaining and set up a list that allows FS
posts? Perhaps if you set one up, you'd see how quickly subscribers
dropped. Yes, I'd love to have a LMR list that allows FS, but I'm sure
I'd tire of it after 30 posts a day of people who join to do nothing
more than use it as a way to advertise for their business for free.

The VX-10 is the commercial equivilant of the FT40, with I believe 99 channels, the capabilities for scrambling, etc. Yes, it is field programmable with instructions from a dealer (it's a bitch though. You thought flying a 747 was bad, try programming the VX-10). The FT-40 when modified (not out of the box) is 410-484, tx & Rx. The VX-10 will do 440-490 with some degragation. I'd suggest, yes, the FT-50. Will do 120-512 full tx with a 'freeband' mod. Nicest damn radio I've ever touched, commercial or not. PL, DPL, scan, DTMF decode.. There ain't a thing this unit can't do short of washing my dishes.

Source record: 184591

Hi there, I'm new to this newsgroup and I joined it for I am a newbie in Amateur Radio.
Although I actually own a Dual Band ICOM IC-Z1/E V/UHF RTX (and waiting for license to be released...), I'm involved in designing HF radios for job, and that's why I'm posting this message:

I heard of a technique for reducing the reflected power from octave filters due to impedance mismatch above cutoff frequency, it seems you have to connect an highpass filter in parallel to the octave filter, the same cutoff frequency, which should present the nominal 50 ohm load at spurious frequencies. I have tried something like that with no success. Does anyone of you know where I can find more specific and in deep information about this tip?

Thank you in advance

Roberto Maggiora

> for $100-$200.

I thought that the whole idea of modifying a CB to a 10M rig is not on
how much money you can really save by replacing a piece of old equipment
with another used gear. The "VALUE" behind such an experiment can be
treasured for the rest of our HAM life.

HAM radio is a hobby that goes beyond just communicating with other
HAM's
and trading each other's gears, if you know what I mean.

> such as the yaesu ft 101 series. or kenwood ts-120.
> the 23channel cb would be a hand full of head aches to convert.
> and unlike cb, ham radio doesn't go in "channels" on hf.
> good luck and 73's de N9ZTR

hmmmm..... I think it is just a sense of rewarding feeling if one can
resurrect a CB and give it a new lease of life. Unless one is too
technically incompetent to even think of some fun projects to work on.
Or maybe one is too busy to do any thinking?

73!

I failed to mention that I also have the LCD mic for
the radio as well. If FT-50 is traded for this, it must
not have the VoiceMail bug.

I would also consider selling the whole package
outright for $440/bo shipped. Again, this includes:

FT-51R w/ mod
Standard battery, charger, and antenna
Extra FNB-31 battery
MC-29 LCD mic. - excellent condition
Yaesu case
DC adapter -- trickle charges batts. while
you use radio
Have manual, dox, receipt, etc.

Source record: 184693

I don't know about commercially-made mounts, but...

I've seen a number of bumper-mounted HF antennas installed on newer cars using home-built mounts. Most seem to be made with angle iron bolted to the chassis and extending out from under the bumper, with no actual connection to the bumper itself.

Another alternative is a frame-mounted trailer hitch (which might come in handy for towing some day, should you ever buy a boat, camper, jet ski, etc).

Hello,

I was hoping that you folks could help me out. Please reply via e-mail as I don't get access
to the newsgroups as easily.

jochoa@LL.mit.edu

OK, now for the problem...

This summer I will be travelling with my teammates on the Race Across America. This is where a bunch of bicyclists race from Irvine, CA to Savanah, GA. Just a quick little spin that takes between 7 to 9 days depending on the weather.

To support our rider we will be using a minivan to follow the rider and an RV as a mobile base camp. The rider and vehicles only stop for 2-3 hrs each night. The remaining time, we are in motion. To coordinate our efforts, we _have_ to communicate.

What happened last time...

The last time we tried this with a pair of plain CB's (no liscense required) and had miserable
results. At times, yelling out the window at the other vehicle was more effective. Many times we had less than a 1/2 mile range. I found a few obvious problems: one antenna horizontal, the other vertical; and the radios were very cheap.

Solutions???

We will be in all kinds of terrain, from Wolf Creek Pass in Coloraado to the plains of grass
in Oklahoma. Each has it's limitations (well, unless your using ELF).

I have heard that there are some newer CB's operating in the UHF bands, but I know little about the relative merits of any of these products.

Is there an optimum trade-off between transmitted power and liscensing hassles? (we primarily are cyclists, not hams)

Any information would be greatly appraciated.

Thanks,

Not trying to be like others but you will probably not find a number to the actual source of an illegal
product over the internet. You might be able to find vendors but to get the guy's number will be very difficult.

If you are looking for information regarding the amps, try http://www.bills2way.com

Good luck, and don't get caught with one of these amps hooked up to an 11M rig.

Jim..

Popular suggestions are the KAM and the PK-232 multimode units.
They aren't bad, but neither performs any better for pure RTTY
than an old Hoff TU fitted with an adaptive slicer. You can build
one of those in a few hours for less than $50 USD (much less if you
have a fairly well stocked junk box). That'll give you about the
best non-DSP performance you'll find.

DSP can be helpful in receiving RTTY buried in noise. The HAL
units, and the SCS PTC II, do a respectable job of digging weak
RTTY out of the noise, though the latter is certainly the high
price solution to RTTY operation. You can do about as well using
Beezley's RiTTY program and the SoundBlaster card in your PC.
That's a good low desktop clutter approach which doesn't sacrifice
RTTY performance in order to achieve reasonably low cost. I believe
he's asking about $100 US for the program. Of course the other
products support more advanced modes than just RTTY, but there
is little contesting activity yet with the advanced modes.

I also performed the diode mod, and have the same frequencies
available on UHF that you do. Maybe Kenwood changed the radios at some
point. I have another problem though. My radio only works on 12.5khz
tuning on VHF now. Does yours do that, too?

Does anyone have any insight?

The KLM-661 was sold in the late '70s, about the same time as the Multi-2700 and the Echo 70, and was actually an OEM'd FDK rig. It was a large, base-station type rig, meant to compete with the Kenwood TS-600 and Yaesu FT-620B. I believe the output was 10 watts. I haven't seen one in years...

From: cbdye@speakeasy.org
Message-ID: <5coa5f$m9d@eve.speakeasy.org>
Source record: 184709

I have a Kenwood TR-7730 2m Mobile radio installed in my truck. I have not found a way to program PL tones in order to access repeaters requiring tone. I have, however, noticed that there is a button on the face of the radio which turns "tone" on and off. Is there a way to program different tones on this radio or is that button something else entirely?

The radio was a gift from my grandfather when I got the license, so I don't have the manual. Any help would be greatly appreciated! E-mail me if you can!

I'm also looking for a mod. I'd like to get the radio to mute both bands on transmitt. Currently, even with sub-band mute on, the sub-band rx audio will come thru when you are transmitting on the main band.

I've already done the transmitt anywhere mod (i.e. cut the green wire loop on the control board behind the front panel). I don't know if that also opens up the rx width? Anyone know?

Steve.

Just thought I would warn others before this happens to them....
Yeasu knows what you were doing (or will know) if you send them back the
rig, and they will tell you that you have voided your warrenty and charge
you $$$$! If you aren't good with an iron have someone else do it for you.
This isn't exactly the easiest thing to do.

You could check out the new Motorola Sport radios on the market.
With an external antenna on the van, it might work just fine -- and no
license required since it works on the newly allocated "family frequencies"
which are in the 400 MHz range I believe.

Then again, you all could get Tech class Ham licenses, handheld
radios and work over local repeaters. A good solution, if you have
the gumption to get a license. Also, local Hams might even set up radio
checkpoints for you if you ask in advance.

Well this one I have to respond to, but notice I did not cross post
across a dozen news groups like our spam did.
What they do not relize is some hams or other groups of hobbyist just
like to swap there toys without making it a living. We just like to
personaly try different types of gear and can't afford to buy a new
piece prior to selling an old piece.
Our swap groups must work well I have always had good respone to my
ads for sale, the spammers must know this well too, because if they did
not know how effective these groups can be we would not see there same
ad cross posted in 50 groups.
Just my thoughts, but if you, like myself would like to see less spam
here simply work to boycott them. I don't mind a reference to a Co. for
help with someones problem, but if I want to see commercial ads I switch
to my web browser!

> good luck and 73's de N9ZTR

I partially agree.. to the 23 ch biz anyway. Just today I was using my
old HiGain conversion
to work the 29.68 FM repeater in my area.

True a used rig can be had at a good price these days but please don't
discourage people from
learning how a radio works on the insides..

Most CB's can be EASILY converted to cover 10 FM/AM/SSB and CW. Some
with certain PLL chips can cover
the entire 10M band.

Personally, I am looking for a SSB rig to convert to 6M!

Gee, that's an easy one. Triple generates more noise to go along
with the signal. That makes it harder to copy signals. REAL hams want
at least triple conversion!

Phil

From: kssk@mnsinc.com
Message-ID: <32EFFFF4.1FC9@mnsinc.com>
Source record: 184729

I recently was loaned an Azden PCS-3000 2M FM mobile rig, but unfortunately there is no manual for it. Does anyone have such a manual, or even have/had this radio and can help me figure out how to set the "band scan" lower and upper limits? Also, what exactly does that six position switch above the mic jack do? It has "Offset X Y Z" and "Scan F B V".. the only thing I figured out is that in the "V" position it does not scan. Hmm.

Thanks.

Please send replies via email.

> paulk@minot.com

The 400 - 512 range after mod seems to apply to the TH-79A but not the 79A(D).

I modified my 79A and it covered 400 - 512. Later, I sold it (it had an internal birdie right on MY repeater output freq) and bought a 79A(D). After mod it only works from 410 - 469. Obviously Kenwood changed the coverage limits when they wrote the 79A(D) software.

You may need to lift off the lower cover and locate the TU board.
I suspect the 7730 uses the tu-75? board. If so, it will have a bank of
dip switches. this is where to control the tone.

If it has 6 or 5 switches e-mail me and I'll mail you the settings.

- * - * - * - * -

Joe, this gentleman had the perfect right, guaranteed by our "Freedom of Speech" , to state his comment. You have a problem with that, evi-dently. You probably don't agree with that "freedom".

We, as reasonable people, must be constantly aware of "over-pricing" in our world. The man was only stating to the un-informed what the price would be of a NEW unit; nothing wrong with that. Too many times, the "unaware" will purchase said item, only to find out, later, he/she could have purchased the same item, complete with full guarantee, whatever that means, for a couple of bucks more.

Sure, that old adage still stands, "A fool and his money are soon parted!",

Had this man not mentioned what he did, when he did, I might have done the same thing - I would certainly convey the message, "DON'T BE THAT FOOL!"

So, just quit trying to "over-price" your item, okay?? So you don't like this disertation either, eh! Someone once said, "Frankly, I don't give a damn!!"

Hi,

I am looking for a source for finals for an ICOM IC-28A.
I don`t want to get it from ICOM because they are too expensive.

I remember a place that sold compatible Toshiba finals for that radio,
but this was a few years ago and I lost the number.

Would anyone know?

Christian

Source record: 184739

Hello All,
On my TH-79A(D) I had the "beyond MARS" mod done to increase the
RX range from 118-174, 440-450 to 118-174, 300-400, 400-512. Everything
happened as it should. I gained the 2 new menu options aswell, but, my
extended recieve range in UHF was only 410-469. Is there something else I
need to do to get the extra MHz? Has this happened to anyone else?

Look fwd to your replies...

Source record: 184742

I have a question about transverters. I have an ICOM 720a that I no longer use for hf operation. I would like to use it on 6m (or 2m) with the use of a transverter. The manual has a section about the use of one and the radio has a transverter input/output connection. It also has a ACC socket that puts the radio in transverter mode. My question is what, where and how do I get a transverter for this unit. Also what are the plus and minus of this kind of setup? I saw an ad for one by Ten-Tec but the spec's don't match what I see in the radios manual. Any help would be greatly appreciated.

don't waste your time or space in your shack trying to convert that radio,
save a little money and hit the hamfests. you can find cheap analog rigs
for $100-$200.
such as the yaesu ft 101 series. or kenwood ts-120.
the 23channel cb would be a hand full of head aches to convert.
and unlike cb, ham radio doesn't go in "channels" on hf.
good luck and 73's de N9ZTR

I'm sorry if this isn't the right place, but I'm looking for an adaptor for a Motorola HT-600's microphone jack. A friend uses it at his ambulance, but it requires a special "external" microphone. He has a regular one, however the connections are not "normal". Is there any adaptor that he can purchase, rather than this special microphone (which is $75..) for this unit? He has the regular Yaesu type (or Radio Shack "style") microphone.

Thanks in advance.

Please reply by email (read my sig..)

Enjoy the new radio. All the features are a little overwhelming at first.
But they are also nifty features that will make using the radio fun. Stick
with it and reread the manual after you are a little more used to the
radio. You will get lots more out of it.

Enjoy

When I was deciding on a new radio I looked at the Yaesu
8500, Yaesu 8000 and the TM-V7A. They are all nice rigs.
The 8500 seemed a bit complicated to me. I'm not
comfortable with a radio which had the knobs on the mike
(its a popular radio that many people prefer I am not
knocking it I like Yaesu products). Reports people had given
me indicated the Yaesu's needed the manual for effective use
(others implied I am too half-witted to operate a radio of
such immense savoir faire -- kiss my ass Bozo). The Yaesu
8000 is also a fine radio but I needed alpha display. I have
been told he 8000 is also missing sub band mute. I am not
Yaesu bashing. Nor am I a blow hard Kenwood devotee.

Kenwood TM-V7A
I liked the 733. It has lots of features BUT without the manual the programming was so complicated your screwed. I also liked the 733 display BUT many the characters were way to small to read while driving. The buttons were to small n(for my fingers) on the 733 and the function button was in a bad spot and way too small. Operation while driving at night was not easy (for me). When you wanted to add a frequency to memory YOU had to keep track of which memories were in use and which were unoccupied. There was not built in CTSS decode ($60 option). Scanning was slow. The last straw that made me upgrade was no alpha memory. I have 40 repeaters in memory and it annoyed me because I was never sure which repeater I was doing the bla bla on.

The TM-V7A seems to be the heir apparent to the 733. It has lots of improvements in the display, programming, button placement and heat sinks. The TM-V7A addressed all the problems above. It has ALPHA MEMORY ! Its easy to read. Its very easy to program. It scans fast. It has all the features of the 733 and lots more in a much easier to use package. EXCEPT ONE FEATURE - NO MUTE - If you want to express your Joy about this to Kenwoood they can be reached at 3106395300 when the talking computer chip answers (to tell you what a valued customer you are) hit 2 then 6 OR you can Email them at cuyeda@ix.netcom.com They are slow to answer More on MUTE later.

The display looks terrible in the ad's but even in direct sunlight the display looks great. It gets lots of "wow's" from friends.

The radio seems to be bug and glitch free. I detected no hangs or problems or memory losses. All the features I tried worked fine. The manual is about 20 pages smaller than the 733 and is indicative of the effective menuing. After a few days with the radio you can put away the manual and leave it away.

Display characters are bright white on a blue background, are very large and easy to read from the drivers seat. When you select a band it displays that band in even larger characters. Even the small words on the display are easy to read from the drivers seat. There is a reverse video setting (blue characters on a white background) for those who like that or just need a change now and then. I like normal mode my girlfriend like reverse video mode on the display. You can read and work almost all the radios features at 60 miles per hour.
Press the menu button and you can click through a bunch of menus. Each of those menus can take you through sub menus.

The "display" menu for instance will allow you to change
the brightness, contrast, reverse video or normal, or auto
dim. In auto dim you select the brightness you want the
radio in. Then when you hit a button the radio gets
brighter. after a few seconds it dims again for normal
operation.
There is one menu that displays instructions for all the
features such as cross band repeat and deleting memories and
all sorts of other features.
The menus for adding auto dial memories etc. are all easy
to understand.
You can set one band to stop scan on carrier and the other
to pause and resume. Or set both bands the same way etc.
There are about 20 menus and each has sub menu options.

The last menu you accessed is the menu that pops up when you
hit menu again. That's nice if you doing the same thing over
again. Say you are toggling between normal display and
reverse display. The menu take you right back there. If your
entering lots of memories the display take you back there
etc.

You can reassign the buttons functions if you want.

MENU# Sub Menu

1 Transceiver guide: (instructions for loads
like cross band repeat etc.

2 Front Panel: Number of Channels or "Visual
Scan", Power on message, Multi-
Function Button labile 3
Display reverse, Display
contrast, Display
Dimmer, Auto Dimmer.

4 MEM chan lock out, VHF/UHF Mem
Channel Ratio,
Mem channel name, Auto PM Channel
Store.

5 Automatic repeater offset,
Offset Frequency,

6 Programmable VFO (Upper/Lower
limits (3 sets
of limits per band))

7 DTMC Number storing

8 Scan resume method

9 Advanced Intercept on/off
(Intermode

reducer)

10 Automatic power off

11 Transmit time out timer

12 DTSS Page code transmit delay,
auto page
cancel, Page Answer back

13 S-Meter squelch, S-Meter
Squelch Hang time

14 Beep volume, Speaker config,
Voice
synthesizer (with optional board).

15 Data Transfer rate, Data TX/RX
Band

16 Microphone control, Programmable
function
keys, DTMF Monitor.

17 Repeater TX Hold
And more!

You can do most things right from the mike such as: reverse offset, change power setting, change frequency, direct enter a frequency, move memory to VFO or VFO to memory, turn off squelch, go into Function mode, start scanning, stop scanning, go to call channel, scan call channel and another channel continuously, change the dual bands to VHF & UHF or VHF and VHF or UHF & UHF.

You can listen to AM and hear aircraft communication. I can pick up several airports and lots of "jet chatter" in a 50 mile radius of my car. I can pick up maritime communication no problem.

There is a simplex indicator mode which starts flashing if a station is within simplex range (when you activate it).

The CTSS decode works very well while repeater surfing. If you hear a repeater just press the tone button for a second and CTSS scan kicks in. It goes through the PL tones and beeps and flashes when it hits the correct one. If the station stops transmitting the CTSS scan pauses and waits for the station to transmit again. This means only one pass through CTSS is needed to find the right PL.

Programming memory:
Set the channel PL offset etc. on VFO mode then hit the function key. The memory display pops up and shows a solid triangle next to the memory number if the memory is occupied. It displays an empty triangle if the memory is not occupied (this prevents overwriting occupied memory as I used to do many times with the 733). Hit memory on the mem number you want and your done. Much improved.

To give that memory a name - display the memory number you want and hit the menu key. Stop at the memory menu option and select name. Enter the name and hit set etc. The name is programmed in. Its intuitive (at least for me). I have done it while driving.

There is a memory lock out that allows the scan mode to
skip a memory. In case you have a repeater where a blabber mouth wont shut up. The radio is simple enough to do all this
while driving.
One feature I like is -
If you were in scan mode when you turned off the rig. When you turn the radio on it jumps right back into scan mode! SCAN is fast. It looks like the thing is scanning 7 to 10 memories a second. Scan is either stop on carrier or stop for a few seconds. You can set each band differently if desired. You can set 2 upper and 2 lower scan limit ranges for each band. I suppose you could scan 144 to 148 then jump to 150 to 154 mhz with the second set of limits. I have not needed or used the second limit. You can also scan a "call channel" and another channel on each band. The display looks pretty busy when all the scans are going.

VisualScan: I don't see what good this is. So I can see there is activity on near by frequencies. What's the big deal I still have to scan them. I just don't get why they went through all the trouble.

MUTE mode is missing.
Kenwood for some reason left off the MUTE mode on this radio. Its on the 733 but not the TM-V7A. This is the only complaint I have. I would not be shocked if later model have mute. The mute key is unassigned on the mike and probably only needs a software change to work. If you want to express your Joy about this to Kenwoood they can be reached at 310639-5300 when the talking computer chip answers (to tell you what a valued customer you are) hit 2 then 6 OR e-mail

Kenwood at cuyeda@ix.netcom.com They are slow to answer. Despite missing mute I have learned to adjust the volume controls and am not going back to the 733 that's for sure.

There is no wireless memory transfer to another like radio. Kenwood says there is software coming to do this.

MODS:
There is a Mars CAP mod for Out of band transmit floating around. Basically you you take off the cover and snip a wire.

INTERMOD:
I live in Intermod hell. Being just across the Hudson river from New York City there is a constant assault from the building top antennas. I own a Yaesu FT-50R, Kenwood 733 and Kenwood TM-V7A. The Yaesu when hooked up to a roof antenna is almost unusable on some bands due to the Intermod. I ended up buying a $66 notch filter from PAR. That eliminated 98% of the problem.

The TM-V7A has an "anti intermod" mode. The TMV7A is better than the other 2 rigs. But it still gets blasted when I'm in the city. Just outside the city I get almost no Intermod but if your looking to totally eliminate Intermod with this radio you are going to need a notch filter.
The Antenna connection is a single PL259 with an internal duplexer (or is that a diplexer).
WHAT I DON'T LIKE
1) while programming the radio from a menu you have to pick a selection in under 10 or 20 seconds. What's the hurry? They could have left a little more time for the driver to decide. 2) Mute and wireless transfer were stupid features to leave off the rig.

In reality this is a very easy rig to use while driving. Its full featured and glitch free. You don't need a
manual (once you spend a little time with it). I will be picking a second one up for home use (when $$$ permits it).

I am using the detachable display. The cables from the 733 work on the V7 but the V7 cable kit came with a plastic holder you click the display in. When you want to remove the display you just unclick it from the holder. Its easier than the 733.

The TM-V7A has LOTS more heat sinks inside and outside than the 733 has. The mod for Mars Cap is just a snip of a wire. Audio reports have been very good.

I like the refinements on the V7A I miss mute but I aint going back to the 733. I am considering buying another for home as a replacement for the 733 at home.

I encourage your to write about what you like and especially what DON'T LIKE or would improve on your radio. The corporate adds only tell good news about zillions of features - not how impossible they are to use. Few of us want to buy the 100+ page manual to see what we are really going to be working with. On Internet we can read what real hams have to say not what a magazine that's trying to sell advertising has to say.

This post was manually optimized for use with voice synthesyzer. Some items may appear to be misspelled to the sighted, but they have just been spelled more phoneticly.

On Sunday, January twenty sixth 1997, Dana Yeomans wrote:

hi there, i aggree with you, i am blind, and have to listen to the voice synthesyzer, and i wish they wouldn't post pictures on web sights. the fellow that invented netscape should have his but kicked, because it don't do the blind any good. so take care all from n4pge in griffin, georgia.

My reply to Dana is as follows:

May I suggest that you switch to a text based browser such as lynx?

To use lynx, you would need an internet account called a unix shell because lynx is a unix program which you operate remotely using an ordinary emm ess doss based terminal program such as telix for windows which has the type of terminal emulations most compatable with lynx such as vee tee one oh two.

Since lynx is purely text based you should have much less trouble from any pictures you would have encountered on web sites using a frame based browser such as netscape.

Lynx is not very hard to learn. It has key press commands instead of the point and click icons so your voice synthesyzer will almost never find something that it can not read. The only graphic visual effect it has are the hyper text items which activate another you are ell if you highlight the hyper text by positioning your cursor over it with your down arrow or space bar and then hit your enter key. However, lynx can allow you to toggle it to display numbered choices instead, if the web page you are on allows it.

I just thought that I should mention lynx to you in case you had never heard of it or did not know what lynx was. If I have not presumed incorrectly, your voice synthesyzer program probably works better when it encounters text than graphics. If so, then maybe my suggestion can help your situation.

You can get a fair price on a unix shell account for twenty dollars per month with unlimited hours from a company called prime net.

prime net is correctly spelled as one word.

spelling is pea are eye emm ee enn ee tee

The toll free number is for prime net is 1, 800, 4 6 3, 8 3 8 6

I am not with prime net only because I got a better deal from a smaller company that only serves southern california.

Good luck Dana and seventy three.

Signed

Ted

you can also improve the sweep on the CAR control by adding a resistor
on the CV line from the front panel switch unit it is J28 on the IF
unit 2 wires Grey & Brown you need to cut the Brown and insert about
80K ohm but anywhere from 60k-90k i find is ok that gives you full
sweep on AM and about the 6 position "varys for differnet bands"for
full output on FM SSB
wich is better than just touching the knob to go from 2-100w

I have tried this and found no other effects good or bad on the 440

Dear Amateurs

I have a few problems with my IC-2700 dual band.

In the beginning during power on it used to transmit for
a few seconds by itself.
Then the PTT from the microphone could not be recognised
by the unit ,and sometimes the Microphone worked but
with alot of noise .
Lately after 3-4 min.of operation(idling) it starts scanning.
by itself all of a sudden.

I have removed the front face and resoldered all the
connections but the problems still exist.

Thank you in advance

Message-ID: <32ef520b.2659385@news.earthlink.net>
Source record: 184774

Don I like the ending, Yes the Family Service Radio or FRS uses the GRMS freq, although assigned to GRMS they were never used so RS got them assigned to the FSR, there are 14 channels and 7 are at 462 and the other at 467, output is less then 2 watts and can not be connected to a base antenna at present no mobile rig is being made as this is for short range communications only eg car to car. If you need the freqs let me know.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their transistor Plectron and
Motorola monitor receivers. They have now been replaced by
portable pagers, and are often available at hamfests in the
$5 - $25 range. Since many are in rough condition and need
repair, a hamfest special is better suited for hobbyists
who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They can be powered from
117VAC or 12VDC with the proper mobile cord. The audio
quality of a Plectron P1, Plectron 700 series, and Motorola
Alert Monitor is far better than any consumer grade scanner
and the sensitivity, image rejection, and intermod immunity
is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz
band, so there were versions optimized for each portion of
the VHF-low band. There were different versions to cover
low and high "splits" in the VHF-high band, too. For |
example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, |
and 49 - 54 MHz versions. There are two VHF high band |
versions of the R8000: 148 - 158 and 158 - 175 MHz. |

Although UHF versions of the 700 series were made, they are |
somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different
options. Both the original P1 and later 700 series are

suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very | desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and | are housed in metal cabinets of various colors. The R8000s | are use the same MC3357 IF/detector/squelch IC used in | crystal scanners, but their crystals are not | interchangeable with ordinary scanners. R8000s were made | in the Chief (tone decoder & carrier squelch) and Patrol | (carrier squelch only) models: |

Band (MHz) Chief Patrol |

_____ |
30-54 R8190 R8150 |
148-174 R8200 R8160 |

Table 3. Plectron 8000 models |

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier

activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal
Signal in University Park, IL, phone (800)524-3021. You
can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone
(800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I have a Yaesu FT-51R that I would like to trade for an FT-50R. I have 2 2-watt batteries, a matching case for the radio, and the DC power adapter from Yaesu. Radio has already been modded to the max. Looking for a 50R, preferably w/ FTT-12, already modded, and whatever else you might have with it. Depending on what accessories you have, a cash difference may need to be made either way. Drop me a line with what you have and what you think an appropriate deal would be. My HT is in excellent condition, and barely used, a little over a year old (with receipt). Email all replies.. Thanks.

Yes, that is one of the most anoying things about the 706. It does that
because the PA kicks in as you hit the keys.

Carl, the actual month and year is usually located just inside of the
main covers on the PCB in Uniden radios, if you feel like looking, it
is probably there and you'd have no need to decode the date code. And
yes, it is OGIC, not OG1C. My BC200XLT's date code on the outside is
OCHH, but on the inside it is April 1988 if I remember correctly.

If you are looking for the date of manufacture of a scanner because you
are concerned about laws regarding scanners and cellular telephones, I
did't know Canada had any such laws. The US made such laws effective as
of April 1, 1992 I think but of course that is only applicable within US
jurisdiction.

Hello All,

I have a Kenwood TS940SAT, in the 7 million serial number range in excellent condition equiped with the External RS232 interface and the 10F chip installed inside for complete PC control. Has one YK-88C1 filter. MC85 peramp mike included.

Non-smoking environement means it's an even cleaner unit. Have manual as well.

Price is $1000.00 plus shipping. If interested pse call 508/358-3687 days or 508/655-8775 evenings or e-mail.

Many thanks,

Frank MacKenzie-Lamb

It seems your house wiring is resonant at your transmitting frequency. I had a similar problem with a neighbor when I blew out his new answering machine. He took it back and exchanged it for another which I also promptly blew out. On the third time, I installed some filters and the problem was solved. This was on 15 meters, by the way.

Your idea of a ferrite core was on the right track, but you probably didn't get enough turns on it. 160 meters being low frequency takes a lot of inductance.

Another idea you might try is to connect a long extension cord - 50 feet or so - so as to shift the resonant frequency and/or move the current node. You could leave the cord coiled up behind the stereo and it would act as a common-mode choke as well. Good luck!

carl, i use an optoelectronics frq meter with my swan 270. i built a pass-thru box. an aluminum box with coax connectors on either end hooked together with coax. at right angle to coax i placed a bnc connector and placed a single loop of insulated 14 ga wire over the coas but under the shield (tricky, but not hard). the loop /bnc feeds the counter and the antenna feedline goes to one end of the coax connection and the other to the tx. works reat for me. plans were in qst a couple of years ago, but dont recall which one. gl and 73 evan ke4bwd

From: jcwren@atlanta.com (John Wren)
Subject: KLM 6m transceiver

Does anyone have any knowledge about the KLM 6m transceiver?
As near as I can tell, this must be an older model. It would be nice
if KLM had a web page.

Subject: New "family channel" radios -What's up with that?

Don I like the ending, Yes the Family Service Radio or FRS uses the
GRMS freq, although assigned to GRMS they were never used so RS got
them assigned to the FSR, there are 14 channels and 7 are at 462 and
the other at 467, output is less then 2 watts and can not be connected
to a base antenna at present no mobile rig is being made as this is
for short range communications only eg car to car. If you need the
freqs let me know.

James

TO ALL

I have put the official TH-79 modifications on my web page.
Those are scanned papers in *.jpg format. You can print them or use a
zoom in a photopaint program to see all details.

Subject: TS440 POWER MODIFICATION SOLVED

you can also improve the sweep on the CAR control by adding a resistor
on the CV line from the front panel switch unit it is J28 on the IF
unit 2 wires Grey & Brown you need to cut the Brown and insert about
80K ohm but anywhere from 60k-90k i find is ok that gives you full
sweep on AM and about the 6 position "varys for differnet bands"for
full output on FM SSB
wich is better than just touching the knob to go from 2-100w

I have tried this and found no other effects good or bad on the 440

=0A=0D=0A>What do you think of this?=0D=0A>=0D=0A> When transmitting on=
160 meters using 250 watts of power, =0D=0A>I am blowing the 3 Amp power f=
use in a stereo in another part=0D=0A>of the house. (yes the stereo is on a=
t the time) This has happened=0D=0A>three times now with different antennas=
. I wrapped the power cord=0D=0A>around a ferrite core but it didn=92t help=
.=0D=0A>=0D=0A>Any suggestions?=0D=0A>=0D=0A>73=92s Patrick Tatro N0WCG=0D=
=0A--=0D=0AIt seems your ho=
use wiring is resonant at your transmitting frequency. I had=0D=0Aa simila=
r problem with a neighbor when I blew out his new answering machine.=0D=0AH=
e took it back and exchanged it for another which I also promptly blew out.=
=0D=0AOn the third time, I installed some filters and the problem was solve=
d. This=0D=0Awas on 15 meters, by the way.=0D=0A=0D=0AYour idea of a ferri=
te core was on the right track, but you probably didn't=0D=0Aget enough tur=
ns on it. 160 meters being low frequency takes a lot of=0D=0Ainductance.=
=0D=0A=0D=0AAnother idea you might try is to connect a long extension cord =

```
- 50 feet or so=0D=0A- so as to shift the resonant frequency and/or move th=
e current node. You=0D=0Acould leave the cord coiled up behind the stereo =
and it would act as a=0D=0Acommon-mode choke as well. Good luck!=0D=0A=0D=

2609. My FT-101E sort-of-exploded

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-30 00:00:00 UTC
From: spammers@must.die.com
Message-ID: <wsandersE4soD6.KCo@netcom.com>
Source record: 184598

I was adjusting the RF input section of an old FT-101E I am trying to get to work (it doesn't receive on 160 through 40) when there was a flash and a very loud bang, as best as I could tell from the area on the underside of the chassis where the 100u 500V caps are connected.

I don't believe a cap blew because I've blown caps before and it has always made a big mess or at least deformed the can in some way. There was no smoke, no soot left behind, just the flash and bang.

I suspect what happened was one of the wires carrying the 600V B+ had its insulation break down and shorted to the chassis. There is a possibly-fresh little crater in the chassis about 1mm across right under one of the wires, but the wire is laid tight right on the chassis and I can't lift it up to see if the insulation is damaged.

I have had insulation break down on 117VAC extension cords before, making a similar sound and flash, and leaving obvious insulation damage.

Another possibility is this: I inherited the unit from my Dad, who made the modification to allow it to transmit on 11m. Dad never was a very good kit builder, bless him, and he insulated the ends of the cut wire with duct tape. The duct tape is all ratty and could have shorted against the chassis. However, this wire only carries 300V and would have smoked a resistor or choke if dead-shorted to the chassis.

The obvious solution is to reinsulate the 600V wires from the chassis. I don't really trust 20 year old insulation. Meanwhile, I'm kind of scared to turn the unit back on. I guess I could wear earplugs while using it.

Any similar stories, solution, etc. are appreciated in advance,

Thanks,
-Wiley Sanders

2610. Heath SB221 Problem: arcing

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-30 00:00:00 UTC
From: Paul_Booth@3Mail.3Com.com
Message-ID: <5coova$cp0@news.nad.3com.com>
Source record: 184599

I'm looking for some advice concerning a problem I have with my
Heath SB221 linear. Although tuned up properly, I experience
severe arcing across the main loading capacitor plates. It works okay
up thru 40m, but cannot handle the higher frequencies. Any
suggestions or hint of where to look? Is this a common problem?
Thanks in advance.

Assuming this is not just a problem of having the external controls
incorrectly set, I think you would be best off getting a manual and
not flying blind. This is not simple enough to just say change the
<fragistammer> and that will always do it.

There were two generations of 453. Early ones (S.N. < 20,000) had
Nuvistors in the input stage; later ones used FETs. There were also
more minor changes as the model progressed. What is your serial #? A
friend of mine has a copy of an early manual that he would sell
cheaply.

I'd love to find a source of KLM data as well. I have an Echo 70 cm
rig and need the manual. I've written to KLM and to other companies
that bought out KLM but haven't received any reply.

Good luck.

2618. WTT: My FT-51R for FT-50R

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-30 00:00:00 UTC
From: cobra295@ix.netcom.com
Message-ID: <5cp68e$9bg@sjx-ixn5.ix.netcom.com>
Source record: 184607

I have a Yaesu FT-51R that I would like to trade for an FT-50R. I have 2 2-watt batteries, a matching case for the radio, and the DC power adapter from Yaesu, and the LCD mic. Radio has already been modded to the max. Looking for a 50R, preferably w/ FTT-12, already modded, and whatever else you might have with it. Depending on what accessories you have, a cash difference may need to be made either way. Drop me a line with what you have and what you think an appropriate deal would be. My HT is in excellent condition, and barely used, a little over a year old (with receipt). Email all replies.. Thanks.

Another alternative: A trunk lip mount with a light antenna like a hamstick. Admitedly they are not as efficient as the bigger Texas Bugcatcher style antennas but they sure are a lot easier to install and there are no holes in the car. I've been using this setup for several years and have had many fine mobile qsos.

It depends on which "Palomar" you are looking for.

"Palomar Electronics" used to build (very-dark-grey-market) CB amps
years ago, but went out of business about fifteen or more years ago.
If you are looking for information on a CB amplifier (even though it
-may- be marked 80-10 Meters), you are "outa luck".

However, "Palomar Engineers", run by Jack Althouse, K6NY, is and
always has been in business ... one of his most well-known products is
the RX-100 Noise Bridge ... he also builds an excellent meter for HF
Amateur use ... imports the Jones Keys from England, sells kits of
Amidon toriod cores, and so on.

You can contact -this- Palomar at:
Palomar Engineers
Box 46222
Escondido CA 92046
Help is available at 619-747-3343

From: mdim@intranet.GR
Message-ID: <9701301115.AA17419@lotos>
Source record: 184619

Dear Amateurs

I have a few problems with my IC-2700 dual band.

In the beginning during power on , it used to transmit for a few swconds
by itself.
Then the PTT (of the microphone) could not be recognised if it was
pressed or not , and some times the mic. worked but with alot of noise.

Lately after 3-4 min. of operation(receiving) it starts scanning by
itself all of a sudden.

I have removed the front face-plate and resoldered all the connections
but the problems still exist.

Any suggestions will be appreciated.

Thank you in advance

There was a running change made about the same time they introduced the
deluxe model that lowered the upper uhf limit to around 469mhz.

I did this several years ago with some Hy-Gain boards, it was real easy.
Does anyone know of a site that supports detailed instructions for CB to
10 meter conversions? I have also seen references for CB to 6 but only
have one article for the old AM boards, I have a Johnson SSB unit that I
would like to convert to 10 or 6 .
Thanks... Jim WA1GPO

> "style") microphone.

Nope... generally speaking, Motorola radios only work with Motorola
accessories. Chances are, you can find a used shoulder mic for the
HT-600 at a hamfest somewhere real cheap. Bring your radio to make sure
it works. You don't want to fumble around with third party equipment
and adaptors -- it will cause misery for you, and I doubt adapting a
cheap mic with the two prongs to a Motorola radio would work in the
first place.

Try looking in newsgroup rec.radio.swap to see if someone has what you
are looking for... or post a message looking to buy.

Hope this helps.

KLM is alive, well, and making antennas. They also own Mirage, the amplifier manufacturer. However, they are no longer OEMing radios. The radios they sold were by such Japanese manufacturers as Echo and FDK.

> primarily are cyclists, not hams)

There is a new UHF "CB" radio out now. It is called "Family Radio
Service" and uses handheld radios on the UHF band. These do not require

licensing, and the manufacturers boats ranges around 2 miles. Refer to the web-page below for more information:

http://home.navisoft.com/nspi/frs.html

Radio Shack sells these radios (made by Motorola) for $179.99 each, and when you buy a pair during their current promotion, you get some bonus accessories: Bonus Pack #2 is a "headset with boom mic..." Bonus Pack #3 is a "belt/bicycle radio case/holder plus earbud with inline microphone."

These sound like they would meet your needs. They require 3 "AA" batteries, which may be adventageous for you since most 2-way radios operate on rechargeable batteries (requiring a source of AC power for the chargers (one charger per radio) which cannot be obtained on the road). There are other radios by different manufacturers, and they are all the same with the exception of the usual bells and whistles.

Hope this helps!

: I'm a new ham, too, and am planning to buy the ft-50r just because i'm
: tired of waiting around for a used bargain and want to get on the air!
: Also, the sales clerk and a customer at EEB we're raving and ranting
: about how good it was. I bough an old Icom ic-2at for $40 bucks at a
: hamfest but it doesn't transmit with enough power to hit the repeater so
: I'm just going to order a new ft_50r tomorrow for $315.

Before you spend your money, there are two things you can do improve
your signal. The first is to use a better antenna. There are lot's
of antennas you can make for 2 meters for a couple of bucks, all of which
would give you at least 3 db improvment.

If an antenna is not good enough, you can buy a 2m HT amp for around $100.
That will give you 30 watts out. You can get them new from radio shack or
HRO, etc. or used from rec.radio.swap or on a swap net. You need a
power supply for the amp, but a scrounged PC/AT power supply will work fine.

Also just to be sure, does the repeater use a PL (CTCSS) tone? if it does,
the ic-2at does not have the necessary hardware to generate the tones and
you probably have to get that other ht.

Wiley,

Unless you're very familiar with the procedures and
precautions required when working on high-voltage
electronic equipment I would STRONGLY suggest that
you not try to do any further work on this unit. Your
best course of action at this point is to either find a
qualified person to help you through this problem or
simply abandon the effort as a learning experience.

In any event, please don't start poking around unless
you're SURE you know what you're doing. The ham
population is aging too quickly. We can't afford to lose you.

73,
Doug - W2DR

2639. SSB modulation level fluctuations

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-30 00:00:00 UTC
From: pruth@alpha.cc.oberlin.edu
Message-ID: <5cqbm4$pju@news.cc.oberlin.edu>
Source record: 184628

I use a Yaesu FT757GX with the stock dynamic desk and hand mics.
Some times I have to speak very loud to get half scale ALC
deflection and 100w output, other times I can speak normally
and get the same deflection and output. I've tried exercising
the mic gain pot in case it's a noisy pot problem which it isn't.
Is there something failing in the modulation circuitry, or could
it be a case of fluctuations in my own voice level from day to
day that might be causing me to think it's the rig, not me?
Thanks for your help. --Bill KB8USZ william.a.ruth@oberlin.edu

If you get the US 2meter range , the way is only one.
It is CPU exchange for USA version.
Japenese version has different programed CPU.

you can also improve the sweep on the CAR control by adding a resistor
on the CV line from the front panel switch unit it is J28 on the IF
unit 2 wires Grey & Brown you need to cut the Brown and insert about
80K ohm but anywhere from 60k-90k i find is ok that gives you full
sweep on AM and about the 6 position "varys for differnet bands"for
full output on FM SSB
wich is better than just touching the knob to go from 2-100w

I have tried this and found no other effects good or bad on the 440

Well, I have a VX-10V and its keyboard programmable. The programming is kind of clumsy though; as a commercial radio its designed to be used by someone who probably isn't interested in programming, they just what to use it. I don't know what the receive frequency limits are.

BTW, its a great radio. Takes alot of punishment and keeps on ticking. Its actually my wifes radio. She does K9 search and rescue so the radio gets rained on, falls in the mud, gets dropped on pavement (I did that), gets dog licks, and spends most of its life rolling around the floor board of the car.

2660. Caveat emptor?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-30 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <5cr3p8$g8m@dailyplanet.wam.umd.edu>
Source record: 184649

Pricing of used gear is dicey. First, people generally try to get for a piece of equipment what they think it is worth, or what they could get a replacement for.

Thus, raining on someone's price in public is short-circuiting their plans to say the least. Caveat emptor, let the buyer beware. An uneducated buyer is VERY quickly separated from his/her money.

HOWEVER, we're hams, remember? A fraternal bunch of people. We're not supposed to screw our brethren or let them be screwed.

I have the right, but not the obligation, to send any message I want (within the charter of the newsgroup) to the group. You have the right to listen or not to listen to what I say. It's that simple.

I will generally inform a seller of an ongoing sale at Radio Shack, and thus buyers might not be flocking in (and why this is the case). Provide with INFORMATION - it's up to the recipient to decide if he/she is to do anything constructive with it - or to merely be offended.

dddavis@atl.mindspring.com (Donald D. Davis, Jr.) writes:

> ... I also really like the Diamond SRH519 because it is very thin and
> flexible.

Ditto here. Like when using one of the various stubby "comic relief"
antennas, the radio now fits nicely into all sorts of pouches and
pockets...except that this antenna actually does something useful.
It can get kinked with rough handling though.

> My only complaint with either is that the housing of the radio is
> designed to allow the stock antenna "shroud" to fit inside and seal.
> The after-market antennas do not ...

Radio Shack sells a package of assorted rubber grommets, the largest
of which fits perfectly around the base of the SRH519 antenna. Keeps
out cruft and retains the snazzy all-black look of the FT-50R.

> rig and need the manual.

Brent:

While KLM may no longer provide info on their 20 year old radios, have you thought about writing to Echo in Japan? They are the actual manufaturer of your rig, and are still alive and well, though not exporting to the United States. I've seen a friend's copy of Japanese CQ (No, I can't read it, but I can look at th epictures, and some ads have ENglish text.) and Echo was still advertising quite recently.

Ted:

The fact remains that you were trying to buy something with a market value of $500-$600 for $200-$300. The market sets the value, and you don't.

If you don't like what used rigs are going for, and I can understand that well, the I really do recommend you go out and buy a brand new Kenwood 2-meter all mode mobile. They are excellent radios, meet all your requirements, and for not too much over $900, you can have one.

73,
Martin

Don't think the 202 is on it's way out. The 404 is being closed out for $199 (not what I would call a DEEP discount), but the 202 was just on the Shack's pre-Christmas sale list - I picked one up for $199 and, like you, think it's a pretty good radio for the money. How about this; RS closes out the 404, keeps the 202 in stock, and introduces a dual band HT for about $350? That way they have a fairly inexpensive HT in the most popular band (202) for beginners and a (fairly) inexpensive dual bander. BTW, just stopped by the local RS tonight and they have their 30 watt 2 meter amplifier on sale for $79. Anybody got any experience with these? They worth the money?

Hi - and thanks for reading. I'm moving and selling off gear I don't use much these days. The TL-922A is as new without a scratch and in perfect working order. One hour on new finals. 10 meter conversion and parasitic suppression professionally done. Original manual. Price is $900 and I prefer pick-up in San Francisco on this one. Am also selling the Kenwood SM-230 station monitor. As new in original carton with manual and cables. $600 plus shipping.

Hi guys

I'm contemplating a new HF rig. My last new one was the Icom 725... one I bought for the convenience of traveling in Europe in 1990. I did not like the RX. It seemed to overload too easily, and especially was problem-laden with strong-signal interference when the noise blanker was on.

I had the opportunity to use a TS450SAT during grad school. I really did not have any gripes about it. The tuner was nice for driving an amplifier.

These are the two latest "new rig" standards against which I will be making my mental comparison.

I know that now the TS450SAT is SOWG (sold out when gone) at most places. It is also a bit more than I really want to spend at the present (given other financial restraints/commitments).

So, what's the opinion you have on the FT840? How is the RX?
Any comments on the SSB (does it have any kind of compression/processing?)?
Any quirks I'd be happy to know about? I am aware already that there is no internal tuner. I can solve that with a small tuner between the 840 and my amplifier.

It appeals to me because of the current price. Given time, I'll probably replace it with a rig with a better RX... but that's probably 3 yrs or so from now.

FYI: My primary interests are DXing and operating CW.

So, anybody got + or - to say about this HF rig???

Tnx!

-Mark

I have a Yaesu FT-51R that I would like to trade for an FT-50R. I have 2 2-watt batteries, a matching case for the radio, and the DC power adapter from Yaesu, and the LCD mic. Radio has already been modded to the max. Looking for a 50R, preferably w/ FTT-12, already modded, and whatever else you might have with it. My HT is in excellent condition, and barely used, a little over a year old (with receipt). If you'd like to consider some sort of trade, please email me with specifically what options/accessories you have, how old the stuff is, what condition it's in, if the radio has been modded (and what it does), and the serial number. Email all replies, thanks in advance.

Firstly I hope the placing of this advert does not infringe any agreement
that I don't know about. If so I apologize in advance.

I have the following radio equipment for sale:

1 LOWE HF-150 digital communications receiver, includes keypad, nicads,
psu, whip and manual. As new.

2 YAESU FRT-7700 Antenna Tuning Unit. Excellent condition.

3 DATONG AD270 Active Antenna.

I would like approximately 250 UK pounds for the lot, or I would be
prepared to split it up and sell items individually.

Please contact me by email rather than through the newsgroups.

2686. Coax connector water sealing "boots"

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-30 00:00:00 UTC
From: pkroth@juno.COM
Message-ID: <19970130.174918.13974.0.PKroth@juno.com>
Source record: 184675

I'm putting up some HF wire antennas and would like to water seal the PL-259 UHF connectors on the coax. I have seen people gunk up the ends with a tar-like substance to keep the water out. I'm sure this provides a good water seal but makes it difficult and messy to disconnect the connector.

I have seen rubber "boots" that you slide on the coax prior to attaching the UHF connector. Once the PL-259 connector is screwed into its female receptacle, the rubber boot is slid over the PL-259.

Does anyone know a source were I could get some of these?

Thanks & 73's

Mine transmits all the way down to 400MHz with the MARS/CAPS mod.. Don't quote me on this, definately look up the mod, but you just have to cut one or two loops inside the radio, and it'll work fine.. As for unusual splits, I'm not sure what you mean.. I can do any split I choose... you can't just go up and down, you have to push in the MHz dial to tune to any split you want.... email me if you have questions.. everything you mentioned works fine on my 610 w/ the mod done.

I have a Yeasu FT-840 and an Icom IC-735. The 735 has been the
workhorse and I originally planned to put the 840 in the car. Then I
got a new car. I opted not to buy the kind of car that has room for a
840.....

When I have used it at home, the RCV is at least as good as the 735.
Maybe even better. No serious measurments, just my ear.

When running the 840 barefoot I have had very good luck breaking pileups
so I have to assume the XMT is clean and that the audio is pretty good.
I think the 840 is a great all round rig. If I had to do it over after
using the 840, I would do it again.....

Hello all...

This is an updated list as of 1/31/96 additions and price changes.

We recently purchased ANOTHER BATCH of DRAKE PA TUBES. So We're extenting the SPECIAL ON...
6JB6 NOS RCA, SYLVANIA, GE, etc. (normally these run $22. ea) Our price while present stock lasts $ 18.ea.

We also have:
4-125A/4D21 have 3 RCA, 1 Amperex NOS $75.ea

2A3 RCA others USED BUT GOOD $25.ea

2A3s I have 10 new RCAs $70.ea
Willing to do some trading on these

6146(A), (W) NOS US (sylv and others) $16. ea

6146B GE NOS $24.ea

4CX300 EIMAC NOS $115.ea

EL-34 SVETLANA matched pairs $30.pr

807 RCA and others NOS $13.ea

811A SVETLANA w/fact warr. $19.ea

572B PENTA (American materials) $54.ea

3-500Z PENTA 13 month warr $118.ea

3-500Z PRIDE 12 month warr $95.ea

4-400A PENTA 13 month warr $170.ea

4-400 US lo hrs certified full output $60.ea

833A Svetlana new w/fact warr $130.ea.

6JS6/6LQ6 US we just got a few in $25.ea

We have no 8950s but we have a few other common sweep tubes.

5868/AX9902 only few hrs use. certified to be full output 1 pair only.

Can you use these? Make us a fair offer, or trade.

WE HAVE MANY OTHER TUBES SO IF YOU DONT SEE WHAT YOU NEED HERE PLEASE CALL.

We take VISA/MC

> Paul_Booth@3Mail.3com.com

First check SWR of high frequency antenna.
If the problem is caused by charging via the plate blocking capacitor it will be cured with an RF choke across the loading capacitor. If the choke is broken or missing this arcing is common. The reason why you don't experience the arcing at low frequencies can be that the antenna has a DC connection to ground in a balun.

Hi David-

I think the thing's neat. As far as "pocket oscilloscopes" are concerned, the market pretty well begins and ends with the probescope, as far as I can tell.

I have not used mine with a computer yet, but I am in the process of tooling up an old 386 to be a dedicated display for the probescope. I think the package will be a lot of scope for the money invested. Digital storage and all that, you know... The ability to store waveforms in the computer should be handy.

Another good thing about it is you can make RF voltage measurements up to its bandwidth of around 5 mc, which is quite a bit better than most DMMs and in a whole nother world from a Simpson 260! :-)

All considered, it's quite a versatile and unique pocketful, I think. And a *STEAL* at a C note.

I just got a trackball to add to my notebook 386 that will be used with the scope, and I hope to get it up and running tomorrow.....

2709. Re: Info on Kenwwood tm v7a

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-31 00:00:00 UTC
From: akent@bga.com
Message-ID: <5crju7$kn4@news3.realtime.net>
Source record: 184540

I just bought a TM-V7A and love it too.

I agree that a mute would be nice, but the rest of the radio is so well done that I don't mind.

I don't have the remote mounting kit yet, so am waiting to put it in my car. I am using it in my shack now, and I'm not sure it will ever leave here. I need another one for my car!

These guys at Kenwood did a bang up job on this radio.

2711. Antenna for 706?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-31 00:00:00 UTC
From: Ben Johnson <bjohn@concentric.net>
Message-ID: <01bc0f28$94aff800$2a4653ce@bjohn>
Source record: 184542

I am getting a 706 to use in the car. Any suggestions re: antennas for use with this rig would be greatly appreciated. I have a 96 Ford Taurus Station wagon. It is a company car, so minimal installation impact is important. Also, I use parking garages on occasion so It would need to be removed on occasion. I would like to cover 2 m, 6m and 20m. Thanks for the help. Please direct responses to e-mail. bjohn@cris.com

Thanks
Ben Johnson

Hi--

Bought a Amp Supply 80-meter monoband SSB rig TR-180 (built by Tokyo Hi-Power) on a swap net, and it arrived with some significant receiver problems. If anyone has a schematic for one of these rigs (any one in the series would do), it would make the job of troubleshooting much easier. I have the operating manual and a block diagram, but would like a component-level schematic. Willing to cover all expenses. You can reach me via E-mail or at:

Communications Quarterly Magazine
109A McDaniel Shore Drive
Barrington, NH 03825

Thanks in advance.

>> I am considering buying the Ten_tec HF Scout rig. Any
>> comments/experiences with it? Thanks.

I've never had one but sure worked a lot. They have good sharp keying that is very easy to copy as are all Ten Tec rigs. The VFO is an LC design that is corrected by an internal counter which is why you hear periodic frequency jumps. As the freq slowly drifts too far, the counter corrects it in one jump. It is noticible but not objectionable. I'm told that the jump is not noticible in SSB. 73 CW OP

Source record: 184549

I have one - it's okay, as far as semi-accurate goes. I didn't use it all that much so I decided to mount it in my car - glad I did! I have it attached to a cell-phone pedestal mount in a convenient place on the transmission hump. I have a combination 2 meter/440 Mhz antenna hard-wired to it, which is mounted on the trunk lid. The unit is also on rechargeable batteries with a trickle charger. I mounted a goose-neck light above it for night-time illumination. For what I use it for, it's just fine. I have picked up signals up to 1/2 mile away confirmed. It is also a nice device to confirm the frequency I am transmitting on my mobile rig(s). At the $30 off discounted price, I'd say it was worth it, but if you have the extra bux, go for the Opto Scout.

2719. FT1000 Problem??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-31 00:00:00 UTC
From: Leith Jennings <leith@inhb.co.nz>
Message-ID: <32F25FE1.32BB@inhb.co.nz>
Source record: 184550

My FT1000, when compared to FT990 or TS940 or most radios, seems to lack audio or gain on receive. Most radios run with the volume control at 9-10 o'clock and I have to run mine at around 12 o'clock for normal everyday listening. The noise floor seems very quiet. Too quiet, as if there is something lacking "sparkle" perhaps. Have I got a receiver problem or is this normal and peculiar to the FT1000. Anyone... any commments???

Timewave's DSP-599zx and DSP-59Y both have DSP based RTTY modems as a standard feature. You need a dumb terminal such as Comp RTTY to run them. Performance will be much better than standard Analog Modems due primarily to optimized filters. Check out our web site at www.timewave.com.

Is an S 1/2 signal a problem in your area? I couldn't set my squelch
low enough to ever notice this in the metropolitan area's I travel in.

I can't imagine this being an issue, I don't recall ever working an FM
signal that was readable with only an S 1/2 unit.

I haven't noticed this on my HTX-212, but I never set the squelch that
low.

I have an FT 101zd that has a problem on 40 meters. When you put it in tune the power comes up then then in about 5 seconds it starts to dip then when it reaches about 25 watts out it raises back to full out put. All other bands are ok. Output ok on all bands. Tried new tubes . The drive to the finals does not change. Plate voltage changes only about 25 volts.

ANYONE seen this before and can be of some help?- I think it may be in the final tank circuit. It appears that the loading caps are ganged and switched in as the freq. gets lower. I have cleaned the wipers on this cap.

Thanks 73

2734. ADMS-2 problem help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-31 00:00:00 UTC
From: kjsmith@violin.aix.calpoly.edu
Message-ID: <5ctg0p$ma9@violin.aix.calpoly.edu>
Source record: 184565

I recently purchased a Yaesu FT-8500 with ADMS programming software (version 1.0...ADMS-2A?), and am having trouble getting info to and from the radio.

The software looks fine, but multiple timeout errors are occuring when I try to read the radio. I've made about 30 attempts thus far, and have gotten one successful read of the radio data. All attempts to write data to the radio have been unsuccessful.

I had the same problem with ADMS-1C software for the FT-50...turns out my computer was too slow. So I upgraded my 386/16 to a 486/60, and while the FT-50 software works great, it looks like the same old problem with the 8500.

Does anyone have any helpful info on this? Let me know what version of software you're using and your processor/speed if you've got a successful FT-8500 system. I do note that my software doesn't have files for programming the FT-3000, so I'm guessing this is early software. Maybe the newer versions (2B, 2C) fix the problem? Does RT Systems do free/cheap upgrades for users with their original disks?

2735. Matching 572B Tube Q (Yaesu FL-2100B FS, SF Bay Area, CA)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-31 00:00:00 UTC
From: spammers@must.die.com
Message-ID: <wsandersE4vxsz.MLD@netcom.com>
Source record: 184566

I just got around to inspecting the FL-2100B that came with the FT-101E mentioned in the previous article, and one of the 572B tubes is broken. Although 572's are not too expensive, if the other tube and the rest of the amp prove to be functional, should I replace both tubes at the same time, or is there a need for matching them?

To phrase the question another way, the FL-2100B is a conventional grounded-grid amp with 2 572B's connected in parallel. I don't know anything about tube tolerances these days - would a replacement 572B bought today be sufficiently close in properties to the other, 20 year old 572B that problems would not result?

With that in mind, this unit is for sale. As far as I know it was never used, but the unit seems to have been dropped at some point, damaging one of the 572B tubes, and chipping off a small piece of ceramic from one of the output pi-network uning coils. The unit has probably not been operated in 15 years if at all. I supposed it is worth about $150 as is. I am located in the SF Bay Area, CA. Please contact Wiley at wsanders@netcom.com.

Thanks,
-wiley KF6IIU

Since a lot of people recommended the Diamon SRH 519, I went ahead and
purchased one. I have to say that I did not notice too much difference
between the diamond and the stock antenna.

Kory

After owning two 850s in a row (and why would I do that? (had a direct lightening hit)
I can tell you that the 850 is a solid piece of gear. Stock, it will do everything
from 12 khz wide super-sounding AM to real tight CW and everything in-between.
The main difference would be that the 850 has seperately selectable IF filters..
and that is really nice. Also...the 850 finals are rated so much higher than the
100w output that you can easily adjust the output with one adjustment internally
for 160w and still be well inside the final's ratings. (not kenwood condoned)
It allowed me to sell my 500 watt linear...and maintain an average 100 watts SSB output.
As a perfect combo, I would add a timewave DSP-9+ ($159) The combination is awsome.
(the 9+ has the best NR mode of any DSP I've heard..read: NO phase roll)

Will-

I found that I could calibrate mine at 78 degrees F, and at 70 degrees, it would measure about 500 Hz high on Two Meters. When it warms up, it is accurate again!

I also found it to be voltage-sensitive. Then, I noticed that the manual specifies that it use the plug-in power supply in order to be accurate. (How could that be? As I recall, I had to buy the power supply separately.)

I suppose mine might just be a lemon. I've never seen a crystal oscillator to be so temperature-sensitive before.

I was recently given a PRC-25 and I would like to get some more info. It appears that the radio's coverage includes the 6 meter band and so I imagine that I could leagally use it there. I know the radio is fm but what is the deviation? Will I be able to talk to NBFM rigs commonly used today?

Also, the radio does not have a battery. Does someone know what the pin outs of the battery connector are so I can rig a battery of my own?

Eric, WD6DGX

2747. Icom-756...Anyone Have Info?

From: Kreblon@ccwf.cc.utexas.edu
Message-ID: <5ctlut$la8@geraldo.cc.utexas.edu>
Source record: 184578

Greetings-
All we have out here is the QST ad. No spec sheets...no info on filtering schemes....no idea what "Adjustable IF-DSP" includes.. and no ship date. All I can find out is that when the first shipments come into the dealers, these have already been sold to the staff and a few customers willing to buy sight-unseen. There will be no demo radios. Why is this a mystery? Maybe I'm missing the drift here. It's mystery time...you want more info, but the dealers just throw up their hands. It looks great... but you have no idea when the radio will be released..or if it has passed FCC inspection...cuz you can't communicate directly with Icom on the internet. Our hobby is communications- Communicate with us.

Does anyone have any credible info on this radio?

Dear Don,

To think that I have to read your countless posts up on the Drake Digest, after learning about this aspect of your personality--one that I will for conversation's sake call, "The Seller Is Always Right".

An argument can be made that Mr. Price Police is actually helping both the seller and any interested buyer, as at the advertised price, a sale may be long in wait, so a little price perspective might speed up a transaction, if that's what the seller really wants. And a buyer will have much less "buyer's remorse" after finding out the truth of the latest new pricing after paying new price for a used, unwarranted unit. Used is used.

Let me use the word HOBBY here.

I, personally, found Herb's response articulate and appropriate, and one that spoke for the integrity of the HOBBY, not for the integrity of money-hungry, non-tax-paying predators that offer none of the protection of a tax-paying legitimate dealer, yet often derive a significant portion of their earnings income from their reselling activity. Such may not be the case here--I don't know.

Forgive me if your litle GRIN sign was supposed to indicate that your comment was tongue-in-cheek, and sarcastic in nature. In that case, I apologize for teeing off, but all other indications are to the contrary.

Sincerely,

Roger WA3FLE

BS. No item on this newsgroup ever sold for more than a buyer was willing to pay. Pathetic indivduals, looking for a way to feel important, patrol the group looking for "violations" (as if they are the final arbiters of what the price should be). We need to discourage these sick, sorry little police. Buyers are perfectly capable of doing their own research.

You have *never* seen any indication of gratitude from would-be buyers toward these losers. Yet they somehow feel that their servivces are appreciated. Those poor little "police"! I wonder what in their lives has caused such a feeling of insecurity?

Dave

And you never see these people telling someone they are selling to low.
Most of the time the people don't even take the time to understand what
the item listed actually is before they inform the entire world that the
item is over priced. My neighbor is selling his house for a lot more
then I feel it is worth but I do not post a sign on his lawn warning
people it is too high. It is none of my business. Same goes for radios.
Sometimes the price posted is a bit high to allow room for negotiation
or to allow for shipping. My experience is that a negative post seems to
kill all intrest in the item listed. If I see something I feel is out of
line I laugh to myself and move on. I would hope that anyone plunking
down hard earned money on equipment would be smart enough to do some
homework first. If not...well...live and learn.

If they use cheap xtals to save a buck, they probably use a trimmer cap across it to stretch it back to freq... The farther off the bare xtal is, the more temp sensitive it will be when it's padded. You could probably look in the schematic and find out what xtal it uses, and order a good one from Int'l Xtal and get some good stability out of the unit.

Later,
Dave

Hello everyone,
I need instruction manuals for the following:
1) Heathkit SB-200 HF amp
2) Yaesu FT-101

A photocopy would be fine as long as it's a good copy.
I would pay for the orignal or the copy charge plus shipping.
Please e-mail me direct at: mrusso@hoflink.com

Thanks, Mark N2FLF

2762. Yaesu ft-11r charging?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-01 00:00:00 UTC
From: Adam B <adamb@rockland.net>
Message-ID: <E4xx2z.2wx@nonexistent.com>
Source record: 184441

The manual says the ft-11r draws 140mA on recieve. The charger that came with it supplies 60mA. HRO told me that leaving the radio on in the charger would overload the power supply.

If it was in the charger and recieving, wouldn't 60mA be pulled from the battery and the other 80mA be sucked form the battery - in essense, not charging during the recieve, but better than not having it plugged in at all? Also, it draws 1.5mA on 5W transmit. Wouldn't the battery take the extra load?

I understand that the charger supplies 12.2 Vdc and the consumpton ratings are for 11Vdc, but why would the drain be automatically put on the charger and not the battery - especially since a direct power conenctio uses one different lead (I assume the hot).

even if it was the case that it would overload the charger, if I ran a 1.5 A power supply to the charging stand, would that work? for that matter, if I ran my car battery or a gel cell to the charging stand, would that work?

Hello everyone,
I need instruction manuals for the following:
1) Heathkit SB-200 HF amp
2) Yaesu FT-101

A photocopy would be fine as long as it's a good copy.
I would pay for the original or the copy charge plus shipping.
Please e-mail me direct at: mrusso@hoflink.com

Thanks, Mark N2FLF

Hello,
I have an ft-726r fully loaded that I would like to upgrade to a 736 for computer control and 1.2 GHZ capabilities. The 726 has the Sat module, 6m, 430,2m and has be re-aligned by the factory. The unit is physically in mint condition. It also has a tone encoder.
I would like to trade it for an ft-736. I know that the ft-736 are hard to come by and costly evin used these days. Which is why I am offering cash in addition. I would exepect that in just about any case the 736 would be worth the 726 fully loaded + cash.

Thanks

Don,
Although I don't have one for sale I STRONGLY recommend the Heil
ProSet. I have a TS850S/AT and have had nothing but excellent reports
on the audio.

Heil makes these with a generic set of plugs, so you will need to buy an
adapter ($14.95) in addition to the headset.

Hi,
Name here is Gerry (WD4BIS) and I have been writing a column for our club newsletter called "New Ham Partner". With the influx of No Code Technicians on the repeater, asking the same kinds of questions I asked 20 years ago, I have been trying to answer them.
Some of the articles are technical, some of them are general information, but they all address subjects that our new friends are struggling with.

I have set up a web page for these articles. On this page, I will place the columns I have already published in past issues of our newsletter. Doing this on a web page has advantages, the big one being that the articles wont expire in a newsgroup, I can edit old ones or add new columns as write them, and I wont have to send re-posts.

The Cost... I will ask that you do not edit the articles, and use my by-line. If you use them, send me an E-mail and let me know when and where. If you have a spare stamp mail me a copy of your newsletter to the address on the page.

Where... http://web2.airmail.net/gerryc/newham.html

Please bear in mind that I am still adding tham as I do them

Sounds like an intresting idea. Nightscopes won't do you much good,
however. Generally they are low light amplifiers. They do not image IR
at all. I suppose I could let you use the IR camera we have at work.
Ut only cost us $250,000 a few years ago.

Good luck and keep us informed if anything comes of your experiment,

Dan - WD8AAU

I did not think anyone would want to change the hftx fan speed and
beware the 706 does need airflow when using hf! but you have a few
options with the tx fan speed i think looking at the curcuit!! if you
remove R 42 1k small smd, located between Q15 and the electrolitic
cap close to the fan plug that should disable the fast fan in tx and
it should just run normal rx speed or the speed after the first mod
but i would not recomend doing the first mod if you disable the fast
speed on tx. or another option could be R 41 22 ohm large smd close to
the back edge of the board right next to fan plug and replace it with
a higher value half watt that should slow down both tx and tx fan
speed but still alow a faster fan speed when in tx you would need to
try a few value's to find one you are comfortable with! anyway let me
know how you get on if you try one or the other sugestion i looked at
doing somthing because it was so anoying hearing the fan running when
the radio was quiet.

good luck!

you can also improve the sweep on the CAR control by adding a resistor
on the CV line from the front panel switch unit it is J28 on the IF
unit 2 wires Grey & Brown you need to cut the Brown and insert about
80K ohm but anywhere from 60k-90k i find is ok that gives you full
sweep on AM and about the 6 position "varys for differnet bands"for
full output on FM SSB
wich is better than just touching the knob to go from 2-100w

I have tried this and found no other effects good or bad on the 440

The C508A antenna is 3.75 inches long. I would not consider it a good
performer for listening outside the HAM bands.

What I do is get some heat shrink tubing and some RTV compound. I "
grease"up the installed coaxial connector with a thick layer of RTV, slip
over the heat shrink tubing and apply the heat gun. The RTV squirts out
all over the place as the tubing shrinks.
I have not had a connection leak in 10 years installing connections this
way. Once the heat shrink is removes the RTV just peels away.

Yet another example of a frustrated would be flim flam artist...

Whats the matter Dave, you old lady won't give you any so your out to see how many unsuspecting amateurs you can screw over with your price inflated junk??

I have heard from several people who have been well pleased with people advising them of overpriced junk that has been offered for sale here and in the rec.radio.swap newsgroup..

Get used to disappointment Dave, as long as you and other would be flim flam artist try and screw over unknowing amateurs with your overpriced junk, you can expect people like me responding and letting them know where they may find a much better deal...

Have a nice day...

2794. FS:Yaesu FL7000 HF amp/Mint under warranty.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-01 00:00:00 UTC
From: jsjones@intrlink.com
Message-ID: <5cuoq7$p7r@lori.zippo.com>
Source record: 184514

For sale a truly mint Yaesu FL7000 HF amp with original box, manual, and accessories. This amp is made to mate up with the Yaesu HF rigs and I have band data cords to fit most later model Yaesu rigs such as FT000/FT1000MP, FT890/840, FT757. This is not your banged up or older edition of this amp so don't expect to buy it for the 1250.00-1350.00 I see some of them sold for that only to find out that they are the older serial numbers and have alot of use on them and are not in mint condition nor still under warranty. I paid over 2200.00 for this amp from HRO and it still has almost 6 months left on the warranty. Call HRO or AES or anyone that sells quality used gear and see what their price is for this fine amp for the latest model made with either no warranty or maybe 30 days and you will see my price of 1500.00 shipped and insured is very good. This amp was reviewed in a CQ issue back in May 1991and was given very high marks and the reviewer said is was built like a battleship and made for many years of trouble free service and after opening it up and doing the 10/12 meter mod I can atest to his finding 100% The workmanship is a thing of beauty. The only amp I have seen built better is the Alpha series of amps which is the reason I am selling this fine amp. I cannot afford to keep both and I want an amp that will give me ful legal limit. I know that is less than an S unit difference but I got get an Alpha and this one has to go. If they made this amp in a 1500 watt output I would by one but they don't so it needs a good home. Call me at 540-890-1453 or E-mail me at jsjones@intrlink.com. 73 and please guys no beat me down calls or E-mail because this is a great price on this amp still with warranty and in mint condition. DE-KS4HK, Steve

2795. WTT: An FT-51R for your FT-50R

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-01 00:00:00 UTC
From: cobra295@ix.netcom.com
Message-ID: <5cvjbs$n4a@sjx-ixn3.ix.netcom.com>
Source record: 184515
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I have a Yaesu FT-51R that I would like to trade for an FT-50R. I have 2 2-watt batteries, a matching case for the radio, and the DC power adapter from Yaesu, and the LCD mic. Radio has already been modded to the max. Looking for a 50R, preferably w/ FTT-12, already modded, and whatever else you might have with it. My HT is in excellent condition, and barely used, a little over a year old (with receipt). If you'd like to consider some sort of trade, please email me with specifically what options/accessories you have, how old the stuff is, what condition it's in, if the radio has been modded (and what it does), and the serial number. Email all replies, thanks in advance.

Hello Lee:

I find that I must run the audio up to about 12 OClock position as well on my FT1000d.

I have used the MARK signal as a test injection signal and only am able to get an S-8 deflection on my s-meter. I wonder what other owners of the 1000d get when using the MARK signal?

I agree with you Lee; the receiver is certainly a quiet one. I am able to hear QRP signals w/o much difficulty.

Good luck in your investigation, OM.

2797. Clegg Interceptor B Manual

I would like to see the fan have a type of delay. Have it speed up normally for TX, and then stay that way for a second or two after you return to rec. This way it would not be so annoying, and of course have the higher speed necessary for cooling during TX. I think Icom should have designed it this way, or else have it thermostatically controlled.
I don't think the delay would be too hard to do. Probabaly add a capacitor in the fan relay circuit. I don't however, want to experiment on my 706.
I most certainly would not mod it to run slower.
The noise is not noticeable in mobile opperation. I use the separation cable at home, and move the main body of the radio under my opperating desk, so I don't hear it as much.
This is about the only thing negative about the 706, that I can find. Other wise I am delighted with this radio.

There are a lot of guys out there (who are not flim flam whatevers) that just simply take offense to the way you do this thing. I don't think half of them disagree with what you do, just the way you do it! I think you have an a good idea, you just seem to piss people off!

If I come up with a way that you could help keep prices in line and do it in a way that would take all of the bullshit away ... would you be interested?

How about this. You watch this newsgroup pretty close. Sit down and come up with a complete list of equipment that you have seen posted and the price. Kind of like this:

Kenwood TM-733A John Doe W3III 12-31-96 $375
Sam Watson W7OO 01-17-97 $355
R&L Electronics $399 Brand
new..price reduced
Jake W9PRQ 01-19-97 $450

Kenwood TS-950SD Sam Screw W3NNN 12-15-96 $1900 Mint
includes VS2

I'm sure you get the idea. I didn't say this would be easy but it could be fun!

You make the list and I will put it on my web site ... FREE! You can call something like the "PRICE POLICE PRICE LIST" YOU can have ALL of the credit for doing it. Anybody who is going to sell some equipment can look at the list and see what it's going for. Anybody who is wanting to buy something can see what they could expect to pay. If somebody needs a price, they can get it. If they don't want to look at the list ... screw em they deserve it!

This way you accomplish the same thing without attacking someone! You could even do it without the web page, just post the list occasionally, like once a week. I am offering you a free web page to do this anyway.

If you are interested, send me an email. If not ... forget it. No reply is necessary.

Try taking a look at:

http://www.mindspring.com/~pda/index.html

which has a logging program which interfaces to the 940.
Also try:

ftp://hamster.ivey.uwo.ca/pub/amsoft/cat/kenwood/

It will display a list of KEN_ directories, of which the
ones below should work with your 940.

KEN_02 RIG-EQF V2.09 KENWOOD RADIO CONTROL BY N3EQF
KEN_04 KENWOOD TS-940S INTERFACE CONTROLLER BY VE3COO
KEN_05 RADIO REMOTE CONTROL PROGRAM FOR KENWOOD RADIOS
KEN_07 KENCON KENWOOD RADIO CONTROL BY KB3MY
KEN_10 AMAZING KENWOOD 4.2 CAT PROGRAM BY D. KOYMANAKOS

All the best.

Eric,

These radios use a wider deviation than ham gear but you can communicate with ham 6 meter rigs, at least
I have done so with mine. One bigger problem is that the PRC-25 and its successor the PRC-77 use a 150
Hz tone squelch, so that unless you leave PRC-25 in the unsquelch position you will not hear incoming
signals. If the other hams have a 151.4 tone on their signal it 'may' work but I am not sure.

You must be careful with the battery. It is supplied by 12 volts but also needs 3 volts for the 2DF4 tube.
I have modified a battery box to do this. The batteries are available. I've seen some advertised for about
$6-$10 a piece. The PRC-77 is solid state and only needs the 12 volts.

2814. Yausu ft-11r power?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-01 00:00:00 UTC
From: Adam B <adamb@rockland.net>
Message-ID: <E4xwsA.n1C@nonexistent.com>
Source record: 184534

After I bought my ft-11r I noticed why the dang thing was fairly cheap,
for it's size... it has NO power input, like a coaxial dc connector.
So, I check a price on the mobile mount and I see it's $83.

I just bought the AA battery case and I noticed the two leads that run
up the inside, directly to the radio, so here is what I'm wondering:

What is inside the mobile mount that warrants the price. Here's my
breakdown of it
$15 for charger
$20 for sturdy mounting bracket
$50 for WHAT????

CAn I just connect 4-12Vdc to those two leads? will that damage
something? does the mobile mount just regulate (at 11Vdc) and protect
against spikes.

MUST I spend $83 to operate w/o battery?

Source record: 184537

If you have an FT-50 with an FTT-12 keypad, and the pl opens up by a signal that was not encoded, well they have a mod for you.

I spoke to Sam Mitsuhashi, the YAESU AMATEUR SERVICE MANAGER, and he said they have a fix for FTT-12's, the keypad that goes on FT-50 ht's.

You only have to send in your FTT-12 and YAESU will install a capacitor to fix the problem.

THIS RADIO KEEPS GETTING BETTER BY THE DAY.

Hi Bob

I don't which dealers or when you last checked with them but the unit was approved by the Fcc
on the 15th of January. The HRO catalog has a good description of the Radio in addition to
an ICOM ad describing the radio. I picked up my unit on the 28th at the Phoenix HRO.
They had 3 on order for the Phoenix store and have only received 1. Sunday morning I
spoke with an LA station and he said he only knew of 1 in LA at least on 6m. At $2349.95
retail I don't know how many radios any one dealer would stock not knowing the demand for
radios in this price range. My conversations with Icom were always informative and I was
even told where to look in the FCC database to see if it had been approved. I am just a
customer of HRO and received no special consideration. I told them a month or too
ago I was seriously interested in the radio and when it came in they called to see if I
wanted it. There was no mad rush of customers to get there names on a list

like for
the IC-706.

Now for the radio

Quad conversion 69.0115 mhz, 9.0115 mhz 455 khz and 15.625 khz into the DSP.
There are crystal filters at 9 mhz (2.4khz) and 455 khz (2.8 khz) and room for an optional
filter at both frequencies. There are wider filters also for FM and AM.
The DSP functions are similar to the IC-775 I think except it is not an option like the
IC-775. The DSP functions in SSB CW and RTTY only. AM and FM has analog detection circuits. The DSP does the SSB modulation and demodulation in addition
to adjustable levels of noise reduction and automatic notch of multiple tones. These
can both function at the same time in SSB. (I don't think the TS-870 allows both at the
same time). In Cw there is an APF automatic peaking filter that can be set to 320, 160
or 80 hz width and its center frequency is adjustable. It has Twin PBT that appears to work very
well with the little I have used it. The IC-756 also has Dual Watch to monitor 2 frequencies
within the same band. The display works well with the "soft keys" down the left side
and bottom of the display. The legend for these keys are on the display and change
with the mode or function. A spectrum scope is available on the bottom of the
display to show activity at + or - 12.5, 25 50 or 100 khz from the main frequency.
This has its own VFO and IF in the radio that functions at all times even with the Dual Watch.
There is a balance control for the main and sub bands. There is a single tuning
knob that is switched between the main and sub band. The speech processor appears to work well if the output meter is a good indication of the power out.
There is a built in antenna tuner that also works on 6m. There is a built in keyer
with 4 memories that can be programmed from the display screen. It also includes a serial number if required. The AGC has slow mid and fast settings.
There are 2 preamps 10 db and 16 db and an attenuator of 6,12 and 18 db.
There are 2 selectable antenna connections for xmit and receive and a third receive only antenna input. There are connections for ALC and Keying of non
ICOM amps in addition to the ACC sockets. There is also a CW reverse mode and adjustable CW tone. The scope can also display the transmit signal

taken at the 69 mhz IF. There are 101 memories and band stacking registers (3) for each band including a "general" for non ham bands. Direct frequency enter
is possible also. Scanning is also included. There are a large number of options that can be programmed from the display. The unit is powered from 13.8 vdc with no internal power supply. The manual is good and includes a block diagram and schematics for the radio. It appears to have 2 DSP chips and
2 microprocessors in addition to a third microprocessor in the tuner. I am

sorry that this is disorganized because I have been just putting down my comments as they come. I have only had limited on air time with the IC-756 because I lost most of my antennas in a bad storm which left me with only 6m that has been dead except for the locals. I spent last weekend and all day
yesterday putting HF antennas up so hopefully in the future I can give all a better and
more organized review of the radio.

Hi There,

In regards to the htx212....There is an inhearent problem with the mother board in the unit.
It seems that if you are using anything other than a 50 ohm feed line you will burn out the board. The symptoms are a whine on tx as well as rx when you tx. There is a simple mod available to you from radio shack as long as the unit is still under warranty. I would suggest getting this done as if you continue to use the rig you will burn up the main board and you will be S>O>L on trying to get it replaced. Another symptom is lower power than expected on low and high....Aprox 8 watts on low instead of 10 and aprox 25 watts on high instead of 45.

I have the same rig and am waiting for the parts to fix....My unit is not under warranty.

I figure my TS-940/SM-220 combo will last me a good long time. Yeah, if I had the bucks I'd buy an FT-1000D, but even then, I'd keep the 940 as a backup rig.

Besides, my 940's paid for. :)

From: "Jeffery A. Purtle" <jpurtle@smartlink.net>
Message-ID: <32F53C41.7FE0@smartlink.net>
Source record: 184349

The Amp has two 4-400 tubes in it in great condition and easily delivers an 1100 Watts carrier on CW with 100 Watts driving it. It has tuned inputs, which easily match it to the 80, 40, 20, 15, and 10 Meter Bands. It was built by a man named Cliff Kurtz, N6ZU, of Stockton, CA and he guarantees it for life. I know of a man who lives in Los Angeles that had Cliff drive all the way down here to fix it. It is built so heavy that nothing ever happens to anything he builds. I am selling it after moving into an apartment and having no need for it in the future as I see it, unless to make my neighbors mad.

Like I said I live in the Los Angeles area, Valencia to be exact and the price would not cover shipping. I would prefer pick-up to make sure the tubes don't get damaged in transport. I will also include a Swan WM-1500 Watt Meter.

I am asking $300.

Please contact me by phone: (805) 287-5953 or Email: jpurtle@smartlink.net

Thanks and 73,

Source record: 184350

As for the weak RX syndrome, I thought the same thing when I first set my FT1Kd next to my TS850. I soon discovered, however, that the FT1K heard everthing the TS850 did, but with greater comfort. I have since added the Timewave DSP599zx to the rig and as a total receive system it functions even better (remember I was kidding about having an FT1000DMP). Now I just have to go throught the calibration procedure to get the S-meter to read at the proper level. Right now S9 is 120 microvolts. It would have been nice if the JA's who calibrated the radio at the factory did their job correctly in the first place.

Having said all of that, my FT1Kd is superior in every respect to my TS850, and I think you would expect that.

Hi:

Just my opinion but this is beginning to sound like children bickering. I believe it behoves us to put our best foot forward in this public arena.

Personally we have a local CB, Yes CB group that conducts itself in a more intelligent manner than a few in this arena.

Don't give in to the poor manners of the few, lets conduct ourselves as gentlemen and follow the Amateur creed!

Enough said!!

Does anyone have one of these? What are the benefits of this radio instead of the FT-50? Are the mods for the FT-50 useable on the FT-51? Does anyone have experience with both of them and can say which they prefer more?

I saw someone wanting to trade their FT-51 for an FT-50 and that confused me a bit unless there is something better about the FT-50.

All information appreciated!

Not possible. You would need a radio that is tuned to the VHF band.
Motorola makes the GP300 for VHF as well.

HELP!!! I need programming info for this radio. I recently purchased the UT-88 tone squelch/scrambler board but I don't know how to program the radio to get the board to work. Haven't been able to locate a programming manual for it (Icom won't sell it to me even though one of their sales reps sold me the radio at a hamfest).

Anybody have a programming manual they can Email me? Or at least Email the instructions? How about a photocopy of it Snailmail to me (I will reimburse you the cost of course)

Thanks

>transceivers OK.)

If it is still in warranty, try to exchange it for another one. The HTX-212 seems a bit TOO picky about SWR but the first one I had was more picky than the one I have now. An example: I realized my HTX-212 emitted a whine when xmitting on low power, but not high power (go figure). The PL259 connector was still snug against the radio's connector but I unscrewed it anyway and screwed it back on again and the radio worked fine. I have never had a problem with any other radio on this particular antenna but the HTX-212 is very picky about SWR. It had better not be larger than 1.1 or the radio will have a fit.

I also don't like the HTX-212 because the squelch isn't tight enough. Even with the squelch turned all the way up, weak signals will still pop in and out while moble. This is very irritating on the ears and prevents the scan mode from proceding.

Good:
It is handy to have something so portable, traces easy to read on
computer, can comment and save, operates with one hand.

Bad:
I am still trying to get used to it. Had not used one since tube days
and the ProbeScope is really different. Seems to be in danger of burning
out if over 70 volts RMS are encountered. Lack of information about
this type of scope.

Hope this is useful.

Source record: 184394

William,

You wrote:

>I have put the official TH-79 modifications on my web page.
>Visit my Homepage http://www.ping.be/RACO

I checked your site and downloaded the mod's. There is something I do not understand and maybe you (or somebody else) can help me out.

First of all: as I read it (also from the schematics) there is no difference between cutting the green wire or removing D308, as they are in series. So when the green wire is removed, for simplicity's sake I translate this to removing D308. The same holds for R403 and D306.
This leaves us with only the diode-matrix to consider.

The official modification list state the following diode-matrices D302-D307:
(listed from left to right, 1= diode installed, 0 = removed)

1011111 type E
1011110 type E2
1011111 type E3
1001111 type E4

Mmmm. This is strange as there seems to be no difference between the E and E3 units. How can this be?

Then the TH-79 A/E service manual states for these diodes:
(left to right: 1= installed, 0=removed, ?=not mentioned)

?01?111 type E
?01?110 type E2
?00?110 type E3,E9

Type E3 according to the mods list is different from the E3 according to the service manual. So this makes it all the more likely that the first one is wrong and the latter one is right.

Comments anybody?

Bart.

Interesting note. Between 1988 and about 1994, most of the stations
on the front cover of CQ had TS-940's. Says a lot about this great
radio.
Yes, I know, there's a whole new crop of "Super Radio's" but the '940
sure was great in its' time.

You do have to run the AF gain up on the '1000. It has plenty of audio drive, however as you get past about the 11 o'clock position. What you're seeing appears simply to be the result of the way that circuit is designed.

I have a '1000D and it is by far the best radio I've operated. I truly believe that this is the best HF rig available (aside from low volume commercial stuff that's overpriced anyway due to lack of cost control and market forces)

2859. ACARS

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-02 00:00:00 UTC
From: William Vynck <RACO@ping.be>
Message-ID: <32F4B195.6204@ping.be>
Source record: 184402
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc, rec.radio.amateur.dx,rec.radio.scanner

Sins a long time i'm looking for a working sollution to receive and
decode the ACARS.

I have 2 different schematics and 2 different software packages. The
software is from AEA and the other from LOWE.

Some people says that the AEA software is working fine with a hamcom,
when i start the program, i see the data-indicator going on and off buth
the screen stay's empty. (ill try'd with squelch and volume settings
buth nothing works)

The LOWE needs a hardware key.

I'm thinking of bying a complete system with software and interface buth
is it going to work with my TH-79 from Kenwood (should i look for the
problem in the receiving of my Kenwood ?)
Still the litle interface from LOWE is to expencive.

MY QUESTION IS :

Are there any people out there who are working with homebrew interfaces
and what kind of software do they use with it ?
Are they welling to share the schematics and software ?
Sins there are not much people who are intrested in the ACARS system i
don't think to get lots of mail.

A SECOND HAND INTERFACE WITH SOFTWARE IS ALSO WELCOME !!

Thanks to all and ill hope my loking is going to end now :-))

William

> N9ROU

I agree with Steve. In addition, the display looks cheap, like a LCD
display on an old laptop computer. The ads have been saying, "at a down
to earth price", but a $2,400.00 street price seem high for this rig.
Will have to wait and see what options are standard. Bob-AA8X

Maybe the Icom biggie for Dayton?????

Have heard rumors that include 160 M thru 70 cm! That would eliminate a
radio and add a whole lot of coverage to my mobile installation!

Guys, guys, give it up. It's these little nonsensical personal
zingers that Mr. Price Police feels compelled to add to his
"arguments" that really tell the story. He's not interested in any
kind of truth, it's just a big anti-social ego-trip for him. Unless
you're a licensed and currently practicing professional in the mental
health industry I'd just steer clear of this one, you're only throwing
gasoline on the fire.

2870. FS: COLLINS radio

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-02 00:00:00 UTC
From: rpilon@achilles.net
Message-ID: <5d2jqs$731@hermes.achilles.net>
Source record: 184413

I have the following amateur radio equipment for sale:

Collins KWS-1 serial #1118
Collins 75A-4 serial #5471
The receiver is in real nice shape, the transmitter in fair to good shape. Asking $1400.00 US for the pair.

Viking Ranger serial #64010
This radio is in real nice shape. Asking $175.00 US.

Tubes:

Quatity 5- brand new in the vaccum sealed can Eimac 4cx250, asking $75.US each.
Quantity 2- brand new in the vaccum sealed can Eimac 4x150, asking $150. US for the pair.

Quatity 2- tube sockets and ceramic chimmneys and hardware for above tubes, make me an offer.

Quantity 12- used Eimac 4cx250, asking $150. for the lot or will include with the KWS-1.

If interested contact via e-mail:

rpilon@achilles.net

or call:

613-489-3519

I'm located in the Ottawa Ontario, Canada area. None of the above prices include shipping.

Thank you

Ray

Knowing what you want isn't worth much unless you know how to get it!

2871. Help repair Yaesu FT530 BNC connector?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-02 00:00:00 UTC
From: n6cr@ix.netcom.com
Message-ID: <5d2k83$j1l@sjx-ixn3.ix.netcom.com>
Source record: 184414

Thanks for reading this...
In the distant past I have seen something posted about this, but I didn't save the info. I have two FT530 talkies that have both developed the same intermitent BNC connector problem internally. I have been into the radios and don't see an easy way to resolder the connector unless the entire back/heat sink of rig is removed (this doesn't look easy). Anyone have this problem licked without shipping it back out to Yaesu in Cerritos?
TNX/73, Rick, N6CR in Atlanta

I have a Bearcat BCT-2 Multi band Scanner (that I have hardly used)
for sale.

It's a pretty neat device in that not only you can just punch in the
state that you are in (and it picks up Police, Highway Patrol, DOT,
weather, etc.) It also alerts you to the presence of radio waves in
the vicinity (has a large red light and beeps). That way it offers
protection from Vascar, airplanes, etc). It retails for $250+ and
mine looks brand new. Includes cigarett lighter plug, mounting
brakets, car radio antenna splitter/and wire antenna (that attaches
to your windshield with small suction cups).

$$ Best Offer.

ITEMS FOR SALE
Brian Webb, KD6NRP
Thousand Oaks, CA
E-mail 102670.1206@compuserve.com

If you decide to buy one of these items, you'll have to come by and pick it up (sorry, but my schedule is doesn't allow me to spend time/money shipping items).

1. RF cable. 30 ft length of RG-8 thick. Mil-Spec BNC male connectors on each end. Fabricated in SEP 1996. Cost: $15 or best offer.

2. 2-Meter FM/SSB Linear Amplifier with receive preamp. RF Concepts model 2-23. 2 W input, 30 W output. Purchased late 1993. Price: $55 or best offer.

3. 6-Meter Dipole Antenna cut for 50.125 MHz. Made of RG 59/U (Z-match section) and RG 8/U thick cable. Fabricated 1n JUN 1995. Price: $8 or best offer.

4. 60 Channel Scanner. Radio Shack model PRO 2024. Does not cover cellular telephone bands. Covers 29-54, 108-136, 144-174, 420-512 MHz. Purchased FEB 1992. Price: $50

5. Teletype/CW Reader. AEA model MBA-RO. Purchased OCT 1996. Works very well with reading Morse Code. Price: $25

6. Worcester AM Broadcast Band Active Antenna. Late 1960's vintage. Price: $ 15 or best offer.

7. Receiver Preamplifier. Ameco model PLF-2. 1.8-54 MHz. Purchased mid-1983. Price: $ 15 or best offer.

> WA3JPG

Clark; I don't have the '890. I have the '900. These radios
are very close. There should be a key combination that you
will need to hod down while turning the radio on. This will
put the CPU in alignment mode and allow you to set the carrier
insertion point. It should have been done by Yaesu when they
changed the filter. The difference shouldn't have been that
much. Suggest you call Yaesu about the possibility that
the filter is bad (mis-tuned). Good luck and let us know how
you come out. Dave. WA0ZZG

I don't know if I'm qualified to make a comment here, but I just bought a 570D as my first radio. I have had HF priviledges for about 1.5 months. THe 570D seems to dig signals out of the dirt extremely well for me. I also use the filtering system quite a bit. I have no trouble separating two signals that appear to be almost right on top of each other. This feature has worked better than my father's 990 Yeasue.

Take it for what it's worth.

2884. WEFAX, FAX, SSTV, RTTY with Sound Blaster = OK

Hello... Brian here!

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version of my FTV software.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside this software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

A registered copy costs US$ 25. Registration promotes the further development of this software and entitles the user to future upgrades

paying only for delivery
expenses, if any.

Fianlly, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

Glenn,
Yes, I sent him a similar message as you and he sent me almost the same reply back. This guy is clearly someone with a deep-rooted lack of self-esteem and ashamed of what he is doing and who he is. That's why he must remain anonymous. He probably is gay himself but lacks the self-esteem to deal with it in an intelligent manner and therefore lashes out at others in an attempt to boost his own self image.

Ron

2887. Re: Modifying A Yaesu FT-470

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-02 00:00:00 UTC
From: cobra295@ix.netcom.com
Message-ID: <5d2uee$c3f@sjx-ixn4.ix.netcom.com>
Source record: 184430

It was a long time since I owned and modified my 470, but
I remember it's an internal modification and an easy one at
that..... i think it's just removing a component or so. It's an
old radio, check a QRZ cd or one of the online FTP databases,
I'm sure it's in there. There is also a keypad mod for extended
receive and there's also one for cross-band repeat. If you use
alt. scanning, there is also a mod to make that "hyper-scan" (ie a
lot faster).. that too is a keypad mod.... it's been a long time, I
can't give you anything more specific than this.. but check in
the different mod servers and CD's.. that's where I got it all from.
That's an excellent radio, hold onto it.. there are times I wish I
had. Good luck...

Source record: 184431

quoting another:

> And you never see these people telling someone they are selling to low.

Well, that seems to be a very valid point and one that I tried to raise the last time this issue came up. I cited a gentleman who was selling an Icom W2A with accessories for $125. Certainly everyone knew his price was low but WHO spoke up? No one! When I mentioned this, I was promptly told that my point was invalid because the seller knew exactly what he was doing. Well, if this is to be the case, let's assume that the buyers have enough sense to know exactly what they are doing as well. No one in this world is going to "hold your hand" and watch out for you. If you try to rely on someone else to make judgements for you, you're in pretty bad shape.

Also, just a small aside. Isn't it unusal that the "police" types never identify themselves. In listening to advice, consider the source. Oh, but we don't know what the source is here......oh well.

I checked out those mods too Bart.

There's another thing I don't understand. The TH-79A's are also
designated as K for U.S.A, and P for Canada. The mod sheet states that
800mhz recieve is not capable with the microprocessors that are
supposedly in these units.

So,... what's the deal with that?... Can I make my TH-79A recieve
800Mhz... ??

> Radio Amateur ONL4021
> QSL via bureau UBA Belgium Hi Bill; you didn't say on what op system or PC you are
running this,
but there are several possibilites;

a. For most Windows users, you MUST run the ACARS software in a DOS mode. This does not mean a DOS box (as you can in Win95) but completly outside Windows. The reason for this is that ACARS and Windows conflict because each wants to control the serial port connection exclusivly. So you must exit Windows (yes, even '95) completly to run ACARS.
b. Leave your squelch completly open. The reason for this is because most squelches don't react fast enough, and part of the message will be lost before the audio reaches the interface.
If you are interested in getting more info on ACARS, come join us on majordomo@grove.net . Send a message like the following with nothing else in the body of the message;

subscribe acars
We also have a digest service (acars-digest) if you are interested in that. To my knowledge there has been no shareware development of ACARS software, but who knows that may change one day...73s Mike (colistowner, ACARS)

>
> Jerry
Quite correct, The only part of an Amateur radio that gets tested is
the receiver if it operates above 30 MHz. The Transmitter never gets
FCC tested. Manufacturers only have to stay with the technical
standards set forth in FCC Part 97 for transmitters, just like any
amateur who builds his own equipment. The receiver falls under FCC
Part 15 as a scanning receiver and is tested for radiation so it will
not bother you or neighbors home electronic equipment. If you look at
the FCC Type Accepted database and enter the ID number on the back or
your VHF radio generally it will come up as a scanning receiver.
You will only find FCC indenity numbers on radios that have receivers
that operate above 30 MHz and the HF Linear Amplifier.

Turn off the radio
Press and Hold the B+# while powering up the radio, continue to hold
for at least 5 seconds after power up.
Now look in the set mode for a new function named PL, turn the main
tuning know until you see 100 PL.

enjoy the AM aircraft bands and expanded receive.

Cliff,

Now that Kenwood is out of the service business, do they still have a
technical line you can call for information ? I understand of their
former techs opened Kenwood West for service, guess he is doing the
" factory " service like Kenwood East is.

I would suspect your business will pick up some.

I saw this rig at a hamfest and spun the dials. Icom did not have any spec sheets for it yet. The scope is kind of neet, but what I noticed most was what the rig was missing. It has no knob to change memory channels. It has no knob to adjust the if notch that it supposedly has. Most important to me was that it does NOT have digital filtering. The dsp is for noise reduction, automatic notch, and I think for transmit equalization. But again it does not use DSP for digital filtering like the TS870, FT100MP, or IC775 rigs do. I found that to be a major dissapointment to me and because of that would not be interested in the rig. I do not understand why they did not put that in this rig. I asked the guy why it did not have this feature and he showed me the slope tuning control. I said - " well my TS850 has that " to which he had no reply. The rig is about the size of my TS850. The controls/knobs on the front looked kind of cheap. The rig looked like a updated IC736. " In the spirit of the IC781 " seemed quite a stretch to me. --- Steve N9ROU

Probably, as of this writing (8 PM PST, Saturday 2/1/97) - nobody.

Icom made one small shipment, approximately ten days ago, consisting of one piece each to a small list of dealers.

Another shipment arrived early this past week, and was held in a Bonded Warehouse for U.S. Customs ... it seems that they (Customs) picked this particular shipment for a "detailed inspection" (open boxes, inspect everything). That shipment was released to Icom on Thursday (1/30), and shipped to dealers on Friday, 1/31.

My suggestion is that you call your favorite dealer, and put one on order ... dealers should have that shipment by mid-week.

(Perhaps a better answer to your opening question would be "Most larger Icom dealers - very soon!"! ;-))

Their service is entirely outsourced as of a couple of weeks ago.
Kenwood West has taken the place of the actual factory service center.
it is like the Kenwood East operation, owned by individuals not by
Kenwood. I was just wondering if his business will pick up a bit. I
am sure Kenwood East and West are capable of doing quallity work. I
hear Kenwood East is good.

Gary.

TO each his own... I recently bought a new TS-570-D, and IMMEDIATELY sold
my "old" TS-850SAT. The 570 does everything the 850 did, and BETTER! I
also have the Timewave 59+, and while it works well, the builtin DSP in
the 570 sounds better to my tin ears.

570:

1. DUAL ANTENNA INPUTS
2. 2 SEPARATE MEMORY/BAND SETTINGS FOR DUAL OPERATORS, OR CONTEST/NORMAL
OPERATIONS.
3. DUAL HIGH/LOW BAND PREAMPLIFIERS FOR BEST SENSITIVITY/REJECTION.
4. GREAT DISPLAY THAT IS EASILR READ FROM A DISTANCE, OR IN POOR LIGHTING
SITUATIONS.
5. A NUMBER OF MENU SELECTIONS, WITH A SCROLLING READOUT SO YOU NEED NOT
REFER TO THE MANUAL FOR AN EXPLANATION OF ITEMS.

gee, THE LIST JUST KEEPS GOING, AND GOING, AND.....

NOW, if I could just find a buyer for my mint TS-450-SAT, ($950) I could
buy ANOTHER 570-D for the mobile....

2918. Removing Yaesu FT 890 filter

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-02 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <21855.854863855@safety.ics.uci.edu>
Source record: 184482
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap

Anyone out there successfully remove the Yaesu FT 890 CW filter from its position on the board and have tips on such removal?

The QST review said they had a lot of trouble, and I have the optional SSB filter in my 890, which takes up the entire side of the CW filter so that I cannot hold it or put a screwdriver underneath it to pry it up. It is very difficult to reach.

I tried solder wick and used the Radio Shack solder sucker and tried my best to remove all solder from the pins. The plated through holes do very well at holding the filter down anyway.

Any help is much appreciated. I had arranged for a swap with a fellow for his narrow CW filter, he got his out (he still has the tiny ceramic filter in the SSB position so he has room to maneuver on the one side). I cannot swap with him since it seems impossible for me to remove mine without damage to the board. Yikes.

2921. FT 890 carrier oscillators alignment

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-02 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <21885.854864116@safety.ics.uci.edu>
Source record: 184485

Hello -

I just had Yaesu remove my ceramic SSB filter and install the optional crystal filter in my FT 890. (Note that it has made it nearly impossible to access the CW filter for removal since they are so close on the board....)

The IF shift control now needs to be moved off center to center the passband, and USB and LSB sound different from center detent. I would like to re set the carrier oscillators but have not been able to locate a service manual so far.

Can anyone tell me where the carrier oscillator adjustments are on the FT 890? I suspect that I can do it by ear and get close enough for my tastes. I just need to know what pots / caps to go looking for, and which oscillator it goes with.

Well, I placed my bet on the 570. The 870 is the replacement radio for the
850, not the 570. It didn't take me very long to get used to the menu system.
The display is unbeatable. The dsp leaves some things to be desired though.
A medium priced Timewave is a lot better then the dsp in the 570. But, put
the two of them together and its unbelievable. Why go with old outdated
technology. If your going for the 850, then pick up a used one for a lot less
money. I am glad I placed my bet on the 570. I think its the best recreational
radios out now. You can be sure of one thing, the other manufactures will be right
on the heals of the 570. No mater which rig you pick, won't go wrong.
Get on the air, pound some brass, scream into the mike and have a ball.

Dave you mentioned the "Wilson", it is a great little radio. I have reworked a few of them for ham bands, however beware the UHF model leaves a little to be desired in ham turf. The vco tends to get a little iffy, and sen. is down. It does work, but it will not come close to the orignal specs at 440, the 150Mhz model works super on 2mts in fact I still have two of them in service. If I can be of help give me a yell e-mail.

From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <5d5ifs$v9p@coranto.ucs.mun.ca>
Source record: 184240

I want to know what features the ADMS-1C computer software offer, (memory channel up/download, etc)? Does the software provide features that the radio don't have without it? Will the software give any control over the radio while it's connected (ie scanning, etc)?

How big is the software and is it DOS, Windows 3.X or Windows95?

I heard of a keyboard mod that will give full 800MHz coverage. Other people told me that only a hardware mod will work (diode type) and most tell me that it just can't be done either way. Can someone who may have this mod done post if it works and how? What is the receiver coverage of the radio after the mod?

How well does the FT50RH perform and what bugs does it have?

How about (if you're REALLY into firebottles) a Technical Materials exciter or a Central Electronics? In the mid-late 50s to early 60s, these companies made some very modern (for their time) rigs. You will likely see some of these at Dayton, at prices a lot lower than Heath, Johnson, or Hallicrafters -- which are now approaching Collins rigs in terms of collectible desirability.

You're likely to see some receiver/transmitter pairs which should merit your consideration -- and you don't HAVE to buy a matched pair; a Heath is happy next to a Hallicrafters. As for price -- well, the best deals go early.

If you could stand to have something that's tube-impaired, how about an Atlas 210 (80-10m) or 215 (160-15m)? These can handle an external VFO, are cheap -- typically around $150 for a nice working unit -- and have a few available goodies like an AC power console and VOX. They're compact and also easy to service. The down-side of the Atlas is that while it's got a superior crystal filter, it's a superion 2.4kHz bandwidth crystal filter. You have to add an outboard audio filter -- or a DSP.

The up-side -- the quality of DSP filters is so good nowadays and the price so low (relative to crystal filters) that a DSP is a wonderful, cost-effective addition to any station, not just a silicon-based Atlas (which is a pretty good rig, actually; I earned WAS 40 Phone on my Atlas).

Hello.

I'm looking for undocumented/secret features in TS-50 or TM-251, both of Kenwood. Perhaps a key combination or something else without opening the transceiver.

I know the TS-50 have at least one secret key combination. If you turn it on while M/V pressed, the transceiver will only tune in channels, and in screen you see "CH 02", "CH 102" etc...

And I'm sure it can do a lot of things more.

Do you know any of them?

Thanks and excuse my english.

Nacho.

Hi there,

I have put a "Ham Radio" page on my personal homepage. It includes some hints and tips to do with our hobby. You are welcome to visit the site at

http://indigo.ie/~murf

If you have any other hints and tips regarding amateur radio, please email me with a view to putting them on my site with credit of course.

Alternativly, if you have any good ham pages that I could link to, then these too are most welcome.

73`s for now

Aidan EI5HW.

By default, the demodulation type for this range is set to Wideband FM.
There is a separate squelch setting for this: WSQL -30-. Note, you
must be receiving in this mode to change WSQL. I don't suggest it,
but by setting AMOD -31- to off, you can select a different demodulation
type using RMOD -32-. The reason I don't suggest it is that the range
you mention is used by UHF TV stations, and they use Wideband FM. The
designers were pretty clever!

Best of luck.

I have a Sinclair Radio Lab's MR-356 mobile duplexer for sale.

This is the six-can notch filter suitable for 5MHz splits.

This is the UHF-lo model (400-440 I believe).

I would like 100$CDN and prefer to sell to local buyer (Toronto).

I'm looking for some sort of A/B switch for 8-pin mics.. It needs to take two female 8-pins and finally come out as another 8-pin female. I haven't seen this available anywhere, maybe someone has one around or can make one cheap. I would do it myself, but I'm not sure where to locate 8-pin male adapters to do so. Any email replies would be very helpful, thanks.

2944. Re: Realistic DX-394 opinions.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-03 00:00:00 UTC
From: bb840@scn.org
Message-ID: <E51LE4.Ewp@scn.org>
Source record: 184258

In a previous article, sba3020@InfoNET.st-johns.nf.ca (Carl Hodder) says:

>
>Can anyone tell me about the Realistic DX-394 general coverage
>SW radio? The price and features look good but is this another DX-300
>or a good receiver?

I got one in December, but I don't have it connected to a good outdoor antenna yet, so keep that in mind. So far I've been happy with it. It quickly jumps to the preprogrammed international broadcast bands, and if programmed to do so, and jump to the amatuer bands as well. You can also direct input any frequency desired. I'm not sure what you mean by "another DX-300", because I'm not familar with that receiver or what problems you are referring to.

>
>I don't hear much on this radio or even seen any reports. The only thing
>I did hear is that some have receiving problems similar to the static
>problem the Sony 2010 had.

I don't know about the static problems your referring to, but I use the DX-394 in a room with florescent lights with no problems. Also, I have photo cells controlling all my outside lights. Usually I notice no noise from the photo cells, but when I do, the noise blanker has taken it out.

>
>I don't expect it to perform like a Drake R-8A but is it a good radio in
>it's class?

I have nothing to compare to, except an old (very old) DX-160, so I can't comment. But the people at QST informed me that they plan an article comparing the DX-394 and several other similar receivers in its price class in a future issue. I suggest looking for it.

>
>One last thing is that I went to our local Radio Shack and seen on a
>preprinted price card layed on the radio "optional CW filter" listed
>as some of the features. The "optional CW filter" was marked over
>with a black marker to cross it out. Is this a featured that is included
>and not an option or an option not carried by RS. Who does make this
>radio for RS? The local RS guy said that's the way they go the price
>card and don't know anything about the marked off item.
>
There is no "optional CW filter". The DX-394 has positions for Stand By (but no Stand By connector on the back), AM, LSB, USB, CW1 (narrower

bandwidth LSB), and CW2 (narrower bandwidth USB). The people at QST told me the DX-394 uses an audio filter to narrow the bandwidth for CW, and they found it to be a little broad.

Like I said earlier, I'm happy with the DX-394 (no I do not work for Radio Shack). If you can wait for the article in QST, that is probably the best option. But for $300 it's not a bad little radio.

Hope this helps. 73 de KD7MK

Hi Gabe-

I'd say if having a transceiver (rather than a separate xmtr and rcvr) is more important than WARC & 160 meter bands, then the Drake TR-4 series would be the ticket. $200 - $400 depending on version and condition. 200+ watts OUTPUT PEP on SSB. Great rig.

If having 160 and the WARC bands is more important than having an integrated transceiver in one piece, then I'd say you'd like my personal favorite rig: the Drake 4 Line twins. There are several vintages/versions and an original set can be had for less than $150 at times. The latest and greatest of that series is the Drake C Line which is (again) my personal favorite of `em all, and they can be had for $400 and up, depending on condition and what options are installed. They'll usually do 125+ watts PEP.

If you'd like any further details, just let me know.

Just for fun, I've attached a picture of the Drake T-4XB and R-4B, which is pretty representative of the whole 4 line.

Let me know if I can help.....

73, Tom KJ5IE

I am curious,
How good is the TS-520 tranceiver's receiver section. Is it
comparable to that of the Kenwood R-599D?. I had a set of Kenwood Twins,
and I must say they were remarkable units. I am looking for a
transciever with the same quality receiver in it, of that vintage,
(solid state with tube finals), or something at least in the same price
area that perform at the level as the Twins (especially the Rx (R-599D)
any experiences to share?
I wonder if Kenwood made a Tranceiver with the R-599D's receiver
circuit. Possibly some one can advise me of a rig as I am missing my
Twins. Jeff

You know David, with the sparse market for radio kits - the way Heath
Kit used to be - a CB conversion can be
quite an enjoyable experience! There's something to be said about
sitting in your car, (my experience)
in the mall parking lot here in northern CA, truning on the old Prez
Grant I converted to 10M all mode
squeezing the old plastic mic to send a simple CQ, and the first thing I
hear is an ON1 station replying
from Belgium. Then on the ride home, JA's, VK's and a few dozen states
plowing in. It made my day!

With technology being what it is, the kits today really don't have that
same feeling one would get when
you could fire up the ol 'TWO'ER' you just finnished building and
alligning and make your first VHF AM
contact. Damn I miss the good old kits!

Subject: FS: Yaesu FT-11R/HP

I have a like new (in the box) FT-11R/HP. Comes with the
5 Watt High Power FNB-38 battery @9.6 Volts, & desktop
battery charger. Has 150 memory channels. This radio
can be programed with your PC, although the manual does

not mention it. It programs like the FT-51R. I don't have
the software, but it's available from Yaesu or any of the
popular radio stores. $165 shipped to your door.

Thanks...de Bill N4DH

Subject: Heath VHF/UHF Deviation Meter

I have no idea of the value of my Heath VHF/UHF deviation meter and
would appreciate input on what kind of price tag to place on it. I would
like to sell it at the Orlando Hamcation (or sooner).

This one is perfect and is calibrated against a Hewlett Packard service
monitor. It includes the Heath power supply, manual and antenna.

You may need to lift off the lower cover and locate the TU board.
I suspect the 7730 uses the tu-75? board. If so, it will have a bank of
dip switches. this is where to control the tone.

If it has 6 or 5 switches e-mail me and I'll mail you the settings.

Subject: mobile antenna bumper mount

Another alternative: A trunk lip mount with a light antenna like a
hamstick. Admitedly they are not as efficient as the bigger Texas
Bugcatcher style antennas but they sure are a lot easier to install and
there are no holes in the car. I've been using this setup for several
years and have had many fine mobile qsos.

Look for tow hooks bolted to the underframe. I removed them and used
these holes to bolt a couple of pieces of large aluminum angle that
extend out beyond the styrofoam bumper on my Honda Accord.

From: jochoa@ll.mit.edu
Subject: Mobile Com. Radio Info Req.

Hello,

I was hoping that you folks could help me out. Please reply via e-mail as I don't get access
to the newsgroups as easily.

jochoa@LL.mit.edu

OK, now for the problem...

This summer I will be travelling with my teammates on the Race Across America. This is where a bunch of bicyclists race from Irvine, CA to Savanah, GA. Just a quick little spin that takes between 7 to 9 days depending on the weather.

To support our rider we will be using a minivan to follow the rider and an RV as a mobile base camp. The rider and vehicles only stop for 2-3 hrs each night. The remaining time, we are in motion. To coordinate our efforts, we _have_ to communicate.

What happened last time...

The last time we tried this with a pair of plain CB's (no liscense required) and had miserable
results. At times, yelling out the window at the other vehicle was more effective. Many times we had less than a 1/2 mile range. I found a few obvious problems: one antenna horizontal, the other vertical; and the radios were very cheap.

Solutions???

We will be in all kinds of terrain, from Wolf Creek Pass in Coloraado to the plains of grass
in Oklahoma. Each has it's limitations (well, unless your using ELF).

I have heard that there are some newer CB's operating in the UHF bands, but I know little about the relative merits of any of these products.

Is there an optimum trade-off between transmitted power and liscensing hassles? (we primarily are cyclists, not hams)

Any information would be greatly appraciated.

Thanks,

It depends on which "Palomar" you are looking for.

"Palomar Electronics" used to build (very-dark-grey-market) CB amps
years ago, but went out of business about fifteen or more years ago.
If you are looking for information on a CB amplifier (even though it
-may- be marked 80-10 Meters), you are "outa luck".

However, "Palomar Engineers", run by Jack Althouse, K6NY, is and
always has been in business ... one of his most well-known products is
the RX-100 Noise Bridge ... he also builds an excellent meter for HF
Amateur use ... imports the Jones Keys from England, sells kits of
Amidon toriod cores, and so on.

You can contact -this- Palomar at:
Palomar Engineers

Subject: Subject of "Overpricing Used Equipment"

--This whole episode --

From: JoMak <jomak@flash.net>
Subject: FS: Icom IC-Z1A dual band HT

You said:

"Price Police wrote:

You may want to lower that price a little, The Ham Station is offer for sale,
brand new Icom Z1A'a with full factory warranty for $344.95, New in the box.."
(snip)

Then, recapping, you reminded us:

Hello and thank you for reading this message. I have an Icom Dual Band
(2m-440) HT that I would like to sell. It is less than 10 months old and
has only been used about a dozen times. It is complete with battery,
antenna, wall charger, LC-123 leather case and remote external mic cable.
I have all the papers and manuals and the original box. I am asking
$325.00 for the whole thing.

Then, you have the audacity to write:

"Get a life and keep your advice to yourself. Who do you think you are
giving such advice?"

Joe
- * - * - * - * -

Joe, this gentleman had the perfect right, guaranteed by our "Freedom of Speech" , to state his comment. You have a problem with that, evi-dently. You probably don't agree with that "freedom".

We, as reasonable people, must be constantly aware of "over-pricing" in our world. The man was only stating to the un-informed what the price would be of a NEW unit; nothing wrong with that. Too many times, the "unaware" will purchase said item, only to find out, later, he/she could have purchased the same item, complete with full guarantee, whatever that means, for a couple of bucks more.

Sure, that old adage still stands, "A fool and his money are soon parted!",
Had this man not mentioned what he did, when he did, I might have done the same thing - I would certainly convey the message, "DON'T BE THAT FOOL!"

So, just quit trying to "over-price" your item, okay?? So you don't like this disertation either, eh! Someone once said, "Frankly, I don't give a damn!!"

> 73 de Paul - N3WYY
> paulk@minot.com

The 400 - 512 range after mod seems to apply to the TH-79A but not the
79A(D).

I modified my 79A and it covered 400 - 512. Later, I sold it (it had an
internal birdie right on MY repeater output freq) and bought a 79A(D).
After mod it only works from 410 - 469. Obviously Kenwood changed the
coverage limits when they wrote the 79A(D) software.

2960. What to do with Yaesu 727R CAT jack?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-03 00:00:00 UTC
From: Matt Staroscik <staroscik@sowest.net>
Message-ID: <32F5A8D5.18F2@sowest.net>
Source record: 184292

I just picked up an old Yaesu 727R dual-bander, and it has an odd feature - a 4800bps digital data port. This "CAT" jack can apparently allow you to control the unit via computer, as well as report signal conditions.

I have the faq from the Oak FTP site, so I have all of the port specs. But, since I am not a coder, and I am a poor hardware guy too, I am wondering what kind of accessories for the data jack might be knocking around. Any help would be appreciated.

Thanks in advance.

Regards,
Matt Staroscik

I have found that with my ft50(s) when receiving on 880MHz
the radio will not break squelch on a channel, however, when
you press the monitor button, the s-meter magically goes up
and a fairly strong signal appears- seems like the squelch
is somehow bogging down the receiver.

2962. Mod for Ic-706

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-03 00:00:00 UTC
From: r.PHelan@www.mac.ul.IE
Message-ID: <2.2.32.19970203101246.006bf3c8@mac.ul.ie>
Source record: 184294

I was looking at the mods for the IC-706 on the net and I decided to try the mod for extended TX on HF and I had a look into my rig and the Diode setup is like,

* Diode Diode * Diode *
* * D59 * * * *

I hope somebody can make sense of this,looking from the front panel and I saw the second Diode(D59) from the left I started to de solder it,as printed in the mod sheet.I reset the rig and went to check if it works but strangely the rig will transmit from 100Khz to 200Mhz without gaps..

Can somebody explain this..

Now I have not checked the power output at these certain frequencies but I will do it tonight...

Have I de soldered the wrong diode because the rig is supposed to TX from I think 1600Khz to 56Mhz or something like that with this mod..but this goes up to 200Mhz...but I did pick what I gather is D59!!!!

Also can somebody give me a part number if I want to replace the diode again..

I would be interested in any ideas,e-mail direct if possible...

Honest to gawd, I am not illiterate, but...

I have inherited a Kenwood TM-331a - without User's Guide, of course.
And Pacific Parts is ordering one for me from Kenwood. But that will
take up to two weeks to arrive.

Can another TM-331a Owner please run through the steps to program a
frequency and CTCSS tone for one of the twenty channels?

MANY thanks ahead of time!

The missing diode to the left of d59 is for tx 118-174 on vhf and also
inhibits tx below 1.6mhz i did the mod on mine and removed d59 and the
one to the left looking from the front! even with the tx open from
1-200mhz the tx is locked out ouside 2m utill you do a further mod
that is in Art-Sci mod book 9a and even after all that i could still
not get any output below 128mhz and above 162mhz until i worked out my
own solution with involed removing a bandpass filter on the main board
and directly coupling it to the intput of a Amp with a lower level
anyway i now have mine confrimed working on vhf from 60mhz up to
170mhz with good reports on the comercial 70-80mhz band over here it
was very tricky to do but i would be interested to hear if yours
already has output outside 2m and how far it goes before pwr drops to
0w maybe the USA models have different spec on the bandpass filter etc

I purchased one of these radios several months ago, and I've been extremely happy with it. It's small, has excellent battery life, and great receive sensitivity. The mechanical lock on the front is a nice feature. As far as ease of operation is concerned, it's the tops. There is a keystroke mod to open up receive from 300-500 mHz and 800-1050 (I think) mHz. Sensitivity seems OK in these ranges also. My sole complaint about the unit is no keyboard lighting at night, and even the backlight is rather wimpy.

Sean:

You are correct, the range of 869-894Mhz is blocked on the W32A. Try tuning from 960 to 984 Mhz and you will hear all the images of cell transmissions.

Can anyone tell me about the Realistic DX-394 general coverage SW radio? The price and features look good but is this another DX-300 or a good receiver?

I don't hear much on this radio or even seen any reports. The only thing I did hear is that some have receiving problems similar to the static problem the Sony 2010 had.

I don't expect it to perform like a Drake R-8A but is it a good radio in it's class?

One last thing is that I went to our local Radio Shack and seen on a preprinted price card layed on the radio "optional CW filter" listed as some of the features. The "optional CW filter" was marked over with a black marker to cross it out. Is this a featured that is included and not an option or an option not carried by RS. Who does make this radio for RS? The local RS guy said that's the way they go the price card and don't know anything about the marked off item.

2977. FT-990 relay clicking? Is this a problem?

Thank you for visiting RS: You have questions, we have answers!!

Yeah right. The usual answer is, "....uuuh, I'm not sure. If it's not in
the catalog......
and, "...I'm not sure if that will work..."

and my favorite is when I have dollar bills in my hand at the check-out and
they ask, "...Your phone number please?"
And I say, "Can we skip that part and get straight to the part where you
just take my green and I won't ask you any questions so you don't have to
give me any answers?"....
And they say, "Your phone number please....."

And I sigh heavily and reply 555-1212 (Relax, they will figure it out
after you leave - maybe!!!!!)

Don, I have a great idea for you. I went to a couple of my fellow ham's places last week and they all had boom mics. This is, they didn't cost a red cent. Do you have one of those clamp-on desk lamps? The one that are on boom and are loaded with springs? If you do, you have a cheap boom mic that really works well, and isn't an eyesore. Also, if you keep the clamp, it's movable without having ugly boreholes all over the place. Here's how you adapt this lamp to boom mic duty:

1) Get a good drill, and drill out the rivets that hold the lamp head in place. (Notice the convenient curve of that plate?)

2) Cut the AC plug off the cord. Take out the wiring. (Notice the convenient ducting for the mic wire?)

3) Get yourself some straight mic wire (Two conductor is sufficient) preferable small enough to fit in the slots that are on either ends of the two booms. (The slots have plastic inserts that can be removed if it doesn't fit) I used shielded speaker cable (About 1/8" OD)

4) Solder the two connectors to either end of the newly placed wire. For the MC-50, the center pin is ground, and you'll see a yellow wire that is the audio pin. (It has a really strange connector, and you'll sadly have to butcher the desk mic for it.) The Kenwood is easy, pin one is audio, pin 7 is ground. But consult the manual to be sure.

5) Get your nice trusty old MC-50 or MC-60a or whatever desk mic you have, and get it off that desk mount.

6) Use a tie-wrap (The ziplock kind) and fasten the mic to the boom, recurve the plate on the boom so that the mic fits snug.

7) Attach both connectors to their appropriate place, and VOILA!

You must already have foot switch, if not, RS sells em pretty cheap, and most HF Radios have PTT jacks at the back of the radio, if not, check out the remote jack (Ground and STBY are what you're looking for).

Enjoy, and if you use this (If anyone does) let Bruce Smith (VE2NHL)
know, he's the creator of this gem of an idea.

73's!

Guys,
The VX-10 is filed programmable! All you have to have is a verion 2 CPU or later
and a handy dandy part from Yaesu (easily possible to get around the part bit).
Once you are done all you have to do is push the light button and the PTT button
while turning on the radio. You are know in the mode where you can select
settings, A-D button assignments, and of course complete radio programming. I
believe I got my VX-10 VHF radio @ 180MHZ before it started to flash. I also got
the radio down into the 136MHZ area as well. The only problem that I have come
accross is an error code of 3 when I have tried to put it in filed program mode
on a few occasions. If you get this you will have to DL the programming
information to the radio via PC. You are dead in the water without it!
Overall....I stay away from the filed programming mode unless I am placed in a
situation where it is impossible for me to reprogramm the radio via PC. It is a
fantastic radio for out of area fires. I may not know the operating frequencies
until I arrive at the scene of a working fire. By the way I have seen these
radios selling as low as $334.00 for the basic model!

2987. Steel or Aluminum Tower?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-03 00:00:00 UTC
From: Larry Gibbs <larrygibbs@ibm.net>
Message-ID: <32F60BC2.3CA4@ibm.net>
Source record: 184319

I have usedd Rohn 25G foldover towers and am aware of their
advantages and shortcomings, but what about a 60 ft. aluminum
tower, with or without guys?

The A tower would not be as strong and would be somewhat larger, while
it would not rust as a S tower will.

I'm thinking that in later years even the climbing a foldover
tower requires is too much. The lighter A tower could be
leaned over (winched) to essentially ground level.

I'd be interested in your aluminum tower experience.

Source record: 184320

Hi,

I am wondering if anyone has hooked up the TS-930 and the SM-220 with
BS-8 Station Monitor in the panadaper mode? The documentation is a
bit contradictory as to where to tap the vertical input source..

The 930 manual says you can't do it, and the 220 manual mentions the
"TS-900 series" briefly, but the wrongly says you need the BS-5, even
though the 930 has the 8 Mhz IF.

Thanks,

Alan

Hi and thanks for reading OM;

I'm looking for good suggestions for an old Heath, or other,
transceiver. The following would be basic considerations:

1. 10 to 80m converage, AM/SSB/CW operation.
- 160 would be a nice addition.
- 150-30m general coverage would be nice as well
2. 100W or greater.
3. AC120V supply.
4. Easily replacable tubes, and still genarally servicable.
5. seperate VFO input.
6. CW filter.
7. Rough idea on what something like this would cost 'cause
I'm a 'goin to Dayton.

Thanks in advance, '73s Gabe Nemeth VE3-SLJ.

PS: Weight is not an issue.

That's right! 800mhz is not available on the later model TH79A's. The FCC no doubt made Kenwood change the processor to disallow these frequencies. Our stupid cell phones don't use digital, and are not encrypted. So you can just pick them up with any ole receiver that tunes there. Most European cells are digital now, and they can receive that band legally.

We're just SOL here in the US.

: it back out to Yaesu in Cerritos?

It's not hard to reflow the probably-cracked solder blob on the PC board, which connects the BNC to the rest of the circuitry. It's right under the copper shield. The trick, however, is to take the screws and parts out in the right order. You have to take it almost all the way apart. I figured it out by trial and error and managed to avoid breaking anything. I'm sure the instructions are in the service manual...which I probably should have bought.

I'm sorry I don't have time to create an ascii graphic of the instructions. I could probably fax you my crude drawing, though...

Hello All,
Can anyone tell me where I can get the Molex-like plug that Icom uses to make up the power cord of the IC-706? I have several vehicles, work and home locations that I would like to use it in, not all at full power, so I don't need the expensive, out-of-stock industrial strength power cord from Icom.

I have checked around most of the electronics stores here in Los Angeles and no one seems to have that particular plug.

>PS: Weight is not an issue.

Let me see if I can help you out here. I'll work from memory on most of this. Here goes...

Heath: No 160m, no WARC-79 bands, no GC receive, no AM, separate AC power supply. CW filters rare and expensive. Most tubes are common and not too costly. Lots of opportunity to do your own repairs on these rigs, since many of them were poorly constructed. Heath gear, once the bugs are worked out, is very dependable and sounds good on the air, all though it's "bare bones" gear.

Drake: No 160m, no WARC-79 bands, no GC receive, pseudo-AM, no CW filter on TR-3, TR-4, and TR-4C, separate AC supply. Finals are EXPENSIVE (three tubes required!), other tubes common and reasonable. VOX amp tube prone to wearing out, and PTT depends on it to work.

Collins: Too darn costly. No 160m, no WARC-79 bands, no GC receive, separate AC power supply. Original CW filters rare and expensive, but I think aftermarket filters may still be available. Rugged 6146B PAs and other tubes not too exoensive. Collins gear just too darn costly due to collector interest. Watch for rigs recently surplused by the US military, as they nearly always need repair work.

Kenwood: Early TS-511 and TS-900 are not too common, and they're basically featureless and obsolete. TS-520 and TS-820 series have no 160m, no WARC-79 bands, no AM, and no GC receive, but do have built-in power supply. Later TS-530S and TS-830S have 160m and WARC-79 bands, but still no AM and no GC receive. These rigs are all solid state except 12BY7A driver and 6146 PAs. The 520, 820, 530, and 830 series are solid, dependable rigs that work well. CW filters are still available from aftermarket vendors.

Yaesu: FT-101 series have 160m, AM, and built-in power supply, but no GC receive and no WARC-79 bands. Many have been butchered by CBers (watch out for this!). Weak receive on 15m and 10m bands too. The sweep tube finals are very expensive and tend to be short-lived. The later FT-901 series have AM, 160m, WARC-79 and built-in p/s, but no GC receive. Complex and trouble-prone. Problems with VFO and display are common (at least from what I hear). Tubes in driver and PA are 12BY7A and 6146Bs.

Tempo: Tempo One was a re-badged Yaesu FT-200. Most of same problems and features as FT-101 series. Watch out for rigs formerly used by CB'ers. Tempo 2020, well, just plain avoid this one. Complex and trouble-prone.

Icom didn't make any tube-type gear.

Ten-Tec didn't make tube-type gear.

Swan: No 160m, no WARC, separate AC supply, some won't accept CW filters, sweep tube finals, very expensive 7360 balanced modulator tubes are hard to come by. Power supplies are trouble-prone and are often pushed right to the limit if you run the rigs at full power. AM derived by un-balancing the carrier and using one sideband. VFOs well-known for drifting and FMing due to p/s problems.

In my humble opinion, one of the Kenwoods would by your best bet, if you can live with a hybrid rig (part solid-state, part tube-type). I would urge you to consider an all-solid-state rig, if you're looking for one to use as a primary rig, since the older ones offer a good value for your dollar these days, and there are no tubes to mess with. Don't get me wrong, I like to play around with tube-type gear, and I even build some of my own. But for my main rig, give me solid-state any time.

Wish I could join you at Dayton... maybe some year...

OK, I give up. I just bought a little MFJ 107B 24 HOUR Clock. I can set the hour and minute all that I want if I want 12 hour time. Holding the SET button and the Hour button gives me ...9,10,11,12,1,2... a 13 would have been nice.

Now I know it has three buttons which gives me eight total options (including not touching it). Does anyone know the secret handshake to get the 24 hour option. It is now flashing 01"four dashes" 01. I tried the instructions which has nothing about it and in fact has the buttons on the opposite (right) side of the display. My clock has the buttons on the left.

HELP

Hi Robert--

I designed the MFJ-9406 and probably know as much about it as anyone. While it might not be fair for me to express an opinion, I would be glad to answer any technical or operational questions you might have. QST and several other publications have reviewed it--and these might be good sources of information. Overall, the reviews have been favorable and it seems well received.

Subject: Help with Kenwood TR-7730 2m Mobile

I have a Kenwood TR-7730 2m Mobile radio installed in
my truck. I have not found a way to program PL tones
in order to access repeaters requiring tone. I have,
however, noticed that there is a button on the face of
the radio which turns "tone" on and off. Is there a
way to program different tones on this radio or is
that button something else entirely?

The radio was a gift from my grandfather when I got the
license, so I don't have the manual. Any help would be
greatly appreciated! E-mail me if you can!

From: David Ho <davidho@one.net>
Subject: Is there such a duplexer?

Dear OM's:

My station is empty but an ICOM R-71 right now. H&R Block told me that
Uncle Sam is going go reward me a station for saving money dilegently
into
HIS savings account. Therefore, I am now in the process of building up
my
casual FM/PACKET VHF/UHF base station. However, I am struggling between
the following obvious and stupid options:

(a) 2 Mono banders and 2 antennas.

(b) 1 Dual bander and 1 antenna.

(c) 1 Dual bander and 2 antennas.

(d) 2 Mono banders and 1 antenna.

I like option (a) but it looks like the choice of 70cm mono is very
limited.

Is option (b) a winner to many of you?

I also like option (c) because I can have some higher gain antennas
(cheaper
too). But this configuration requires a duplexer that I don't know even
if
it exists.

Option (d) sounds like a "Do"able option. Is there anything bad about
that?
Which duplexer is good for this configuration?

Your input is very valuable so please response via newsgroup or e-mail.
Thanks in advance.

Very 73!

>sure, but I have sometimes thought it would be handy to have something
>like that to hand to non-licensed family members for car-to-car
>communications and such on trips. Anybody have more particulars on
>this?

For serious car-to-car-type communications, you might want to consider
the GMRS. These FRS units are virtually worthless for any serious work.
One-half watt...fixed antenna...and, as of now (as you see) quite
over-priced.

Whereas Maxon makes the 210+3 for $160-180...with CTCSS capability, and
a full five watts when used on 12VDC. A no-test, $60.00 license covers
all family members residing in the same household for five years.

>Here are my questions to the gurus:
>
>1. Which hardware and software you would recommend for RTTY?

Popular suggestions are the KAM and the PK-232 multimode units.
They aren't bad, but neither performs any better for pure RTTY
than an old Hoff TU fitted with an adaptive slicer. You can build

one of those in a few hours for less than $50 USD (much less if you
have a fairly well stocked junk box). That'll give you about the
best non-DSP performance you'll find.

DSP can be helpful in receiving RTTY buried in noise. The HAL
units, and the SCS PTC II, do a respectable job of digging weak
RTTY out of the noise, though the latter is certainly the high
price solution to RTTY operation. You can do about as well using
Beezley's RiTTY program and the SoundBlaster card in your PC.
That's a good low desktop clutter approach which doesn't sacrifice
RTTY performance in order to achieve reasonably low cost. I believe
he's asking about $100 US for the program. Of course the other
products support more advanced modes than just RTTY, but there
is little contesting activity yet with the advanced modes.

Date: 1997-02-03 00:00:00 UTC
From: Leith Jennings <leith@inhb.co.nz>
Message-ID: <32F607FF.1501@inhb.co.nz>
Source record: 184375

My new FT990 does not seem to have a facility to monitor my own transmitted SSB audio as most other tranceivers do. The FT 1000 and TS940 etc has a "monitor" control on the front panel to allow you to hear your own voice. The CW monitoring is fine cause it regenerates its own audio. Is my radio genuinely lacking the feature or is my new pride and joy simply not designed to monitor it's own outgoing audio. Can anyone help?

Because it's not just one person doing it. It's much too commonplace. If
it were just one person I'd have done that, but at the going rate I
needed more of a "shotgun" effect.

Just thought I would warn others before this happens to them....
Yeasu knows what you were doing (or will know) if you send them back the
rig, and they will tell you that you have voided your warrenty and charge
you $$$$! If you aren't good with an iron have someone else do it for you.
This isn't exactly the easiest thing to do.

From: sba3020@InfoNET.st-johns.nf.ca (Carl Hodder)
Subject: How to read Uniden Date codes?

Can someone tell me what year and month a radio was made by Uniden from
it's date code? The code I have is "OG 1C". The number 1 could also
be a letter "I".

Please post or email any answers you may have.

Looking for a:

AOR AR-2515 scanner (1988 vintage)

JIL SX-400 Scanner with/without the optional accessories (1985 vintage)
*RF-1030 up convertor, *RF-5080 down convertor, *RF-8014 down
convertor, *ACB-300 antenna control box, *RC-4000 data interface
for NEC 8801A computer, *P-1A power supply unit. *Service manual.
* also interested in buying the accessories without SX-400

Bearcat CompuScan 2100 scanner
*This model scanner connected to a C64 computer (1984 vintage)

Larry,

IRCI stopped publishing the newsletter a few years ago due to
insufficient subscriptions. It was a great service.

The closest thing to it today is the Icom Technical Information Net, on
the air at 14.317, 13:00 EST (Eastern Time) Sundays.

73,
Martin

> - John, KD4DTS

The KLM-661 was sold in the late '70s, about the same time as the
Multi-2700 and the Echo 70, and was actually an OEM'd FDK rig. It was a
large, base-station type rig, meant to compete with the Kenwood TS-600

and Yaesu FT-620B. I believe the output was 10 watts. I haven't seen
one in years...

From: Tracy Hooker
Subject: RS HTX242 Intermod

I have a friend who has one of these radios. He is getting all kinds of
intermod, from police (155.19 coming over 146.64) to taxi services. Is
this normal for this radio? I hope that there is a problem with the
radio rather than a poor design. He is a new ham, and I feel kind of bad
because I helped him pick it out!

PS We bought it used, so we cant return it to RS (I wish I could !!!)

Chris,

I have an ICOM 735 with transverter I/O connections. I also have the
Ten-Tec 1208 6 meter tansverter that I built from the kit. It works well
and does not require nor make use of the transverter connection on the
735. It will work with any 20 meter HF rig whose RF power output can be
adjusted to 5 watts. It will work with up to 10 watts input if some
resistors are changed.

If you require a transverter that that makes use of the transverter I/O
connections on your radio then contact a company called "Down East
Microwave", RR1 Box 2310, Troy ME 04987. 207-948-3741.

Good Luck,

Brien

Down East Micorwave makes them. I have a six meter version and it works quite
well although it doesn't cover the entire band (something they don't tell you
till after you've bought it). Check QST for address and phone number.

This is typical of internal tuners. My TS-940s did the same thing when trying to load a 160 dipole. The problems is due to high currents circulating through the little torriod coils in the tuner when trying to match a low impedance. My dipole had an impedance of around 15 ohms at the frequency I was trying to match. As the coil headed up, the inductance of the coil would change which resulted in what appeared to be a higher swr. Eventually the torroid burned out.

Your problems is simply that you are trying to match an "out of range" impedance. The cure would be to either change the length of the antenna or the feed line. Try adding about 10 or 20ft to your feeder and see if that helps. Doing this will cause the current point to appear elsewhere

other than at the rig and make matching easier.

Well this one I have to respond to, but notice I did not cross post
across a dozen news groups like our spam did.
What they do not relize is some hams or other groups of hobbyist just
like to swap there toys without making it a living. We just like to
personaly try different types of gear and can't afford to buy a new
piece prior to selling an old piece.
Our swap groups must work well I have always had good respone to my
ads for sale, the spammers must know this well too, because if they did
not know how effective these groups can be we would not see there same
ad cross posted in 50 groups.
Just my thoughts, but if you, like myself would like to see less spam
here simply work to boycott them. I don't mind a reference to a Co. for
help with someones problem, but if I want to see commercial ads I switch
to my web browser!

Hi All,

We're looking for a Solid State Grid Dip Meter, either new or used (Millen unit prefered). Delivery is to Israel. Can anyone help?

When responding, please email directly in addition to posting here, since our news server isn't very up to date. Please note that you must edit the reply email address (remove the .NOSPAM postfix). This has been done in an attempt to reduce the amount of junk mail received here from automatic mailers. Thank you.

regards,
techno

their web site (www.yaesu.com) has all the specs on the radios. You can also request literature from there and they send you brochures. As for new prices, check the HRO page (www.hamradio.com) for the online price database.

Have only heard rumers of a new ICOM 708. I am looing for someone in the "business" or "INSIDE" to tell the facts about new equipment about to be released. I think there are a lot of people "dreaming up" what they would like to see in a new radio. All I and the other people in this newsgroup want is solid facts. The reason I writing this is I am getting E MAIL from guys saying the NEW ICOM 708 will have built in "GPS". Come one! I wasn't born yesterday!

To paraphrase you "Huh? What the hell are you talking about". I kinda thought the purpose of this group is amateur radio equipment, not business practice and/or whining.

Reminds me of the story of the boy who came home and told his day that he just sold the family dog to an old man for $1,000. The dad, surprised, told the little boy that the dog wasn't worth that much. Could the boy show him the old man who was crazy enough to give him $1,000. The boy looked up at his dad and said that the old man didn't give him cash, just two $500 kittens. For the parable impaired, every value is relative.

Remember this is a hobby, this is a hobby, this is a hobby.

Mark

=0D=0A> Hi - love to see it. Just got the radio this week and got it runnin=

g=0D=0A> OK but find that the many features are a brain-time buster to get =
on=0D=0A> top of - so my thoughts are to watch the comments on usenet and p=
acket=0D=0A> and just learn, learn, learn. Also thinking about getting into=
=0D=0A> programming it. Any and all tips appreciated. =0D=0A> =0D=0A> 73,=
=0D=0A=0D=0AEnjoy the new radio. All the features are a little overwhelming=
at first.=0D=0ABut they are also nifty features that will make using the r=
adio fun. Stick=0D=0Awith it and reread the manual after you are a little m=
ore used to the=0D=0Aradio. You will get lots more out of it.=0D=0A=0D=0AEn=
joy=0D=0A=0D=0A=0D=0A=0D=0A=0D=0AWhen I was deciding on a new radio I looke=
d at the Yaesu=0D=0A8500, Yaesu 8000 and the TM-V7A. They are all nice rig=
s.=0D=0AThe 8500 seemed a bit complicated to me. I'm not=0D=0Acomfortable =
with a radio which had the knobs on the mike=0D=0A(its a popular radio that=
many people prefer I am not=0D=0Aknocking it I like Yaesu products). Repor=
ts people had given=0D=0Ame indicated the Yaesu's needed the manual for eff=
ective use=0D=0A(others implied I am too half-witted to operate a radio of=
=0D=0Asuch immense savoir faire -- kiss my ass Bozo). The Yaesu=0D=0A8000 =
is also a fine radio but I needed alpha display. I have=0D=0Abeen told he 8=
000 is also missing sub band mute. I am not=0D=0AYaesu bashing. Nor am I a =
blow hard Kenwood devotee.=0D=0AKenwood TM-V7A=0D=0AI liked the 733. It has=
lots of features BUT without the=0D=0Amanual the programming was so compli=
cated your screwed. I=0D=0Aalso liked the 733 display BUT many the characte=
rs were way=0D=0Ato small to read while driving. The buttons were to small=
=0D=0An(for my fingers) on the 733 and the function button was in=0D=0Aa ba=
d spot and way too small. Operation while driving at=0D=0Anight was not eas=
y (for me). When you wanted to add a=0D=0Afrequency to memory YOU had to ke=
ep track of which memories=0D=0Awere in use and which were unoccupied. The=
re was not built=0D=0Ain CTSS decode ($60 option). Scanning was slow. The l=
ast=0D=0Astraw that made me upgrade was no alpha memory. I have 40=0D=0Are=
peaters in memory and it annoyed me because I was never=0D=0Asure which rep=
eater I was doing the bla bla on.=0D=0A=0D=0AThe TM-V7A seems to be the hei=
r apparent to the 733. It has=0D=0Alots of improvements in the display, pro=
gramming, button=0D=0Aplacement and heat sinks. The TM-V7A addressed all th=
e=0D=0Aproblems above. It has ALPHA MEMORY ! Its easy to read. Its=0D=0Aver=
y easy to program. It scans fast. It has all the features=0D=0Aof the 733 a=
nd lots more in a much easier to use package.=0D=0AEXCEPT ONE FEATURE - NO=
MUTE - If you want to express your=0D=0AJoy about this to Kenwoood they ca=
n be reached at 3106395300=0D=0Awhen the talking computer chip answers (to =
tell you what a=0D=0Avalued customer you are) hit 2 then 6 OR you can Email=
them=0D=0Aat cuyeda@ix.netcom.com They are slow to answer More on MUTE=0D=
=0Alater.=0D=0A=0D=0AThe display looks terrible in the ad's but even in dir=
ect=0D=0Asunlight the display looks great. It gets lots of "wow's"=0D=0Afr=
om friends.=0D=0A=0D=0AThe radio seems to be bug and glitch free. I detecte=
d no=0D=0Ahangs or problems or memory losses. All the features I tried=0D=
=0Aworked fine. The manual is about 20 pages smaller than the=0D=0A733 and =
is indicative of the effective menuing. After a few=0D=0Adays with the radi=
o you can put away the manual and leave it=0D=0Aaway.=0D=0A=0D=0ADisplay ch=
aracters are bright white on a blue background,=0D=0Aare very large and eas=
y to read from the drivers seat. When=0D=0Ayou select a band it displays th=
at band in even larger=0D=0Acharacters. Even the small words on the display=
are easy to=0D=0Aread from the drivers seat. There is a reverse video sett=

ing=0D=0A(blue characters on a white background) for those who like=0D=0Ath=
at or just need a change now and then. I like normal mode=0D=0Amy girlfrien=
d like reverse video mode on the display. You=0D=0Acan read and work almos=
t all the radios features at 60 miles=0D=0Aper hour.=0D=0APress the menu bu=
tton and you can click through a bunch of=0D=0Amenus. Each of those menus c=
an take you through sub menus.=0D=0AThe "display" menu for instance will a=
llow you to change=0D=0Athe brightness, contrast, reverse video or normal, =
or auto=0D=0Adim. In auto dim you select the brightness you want the=0D=0Ar=
adio in. Then when you hit a button the radio gets=0D=0Abrighter. after a f=
ew seconds it dims again for normal=0D=0Aoperation.=0D=0AThere is one menu =
that displays instructions for all the=0D=0Afeatures such as cross band rep=
eat and deleting memories and=0D=0Aall sorts of other features.=0D=0AThe me=
nus for adding auto dial memories etc. are all easy=0D=0Ato understand.=0D=
=0AYou can set one band to stop scan on carrier and the other=0D=0Ato pause=
and resume. Or set both bands the same way etc.=0D=0AThere are about 20 me=
nus and each has sub menu options.=0D=0A=0D=0AThe last menu you accessed is=
the menu that pops up when you=0D=0Ahit menu again. That's nice if you doi=
ng the same thing over=0D=0Aagain. Say you are toggling between normal disp=
lay and=0D=0Areverse display. The menu take you right back there. If your=
=0D=0Aentering lots of memories the display take you back there=0D=0Aetc.=
=0D=0A=0D=0AYou can reassign the buttons functions if you want.=0D=0A=0D=0A=

onitor.=0D=0A=0D=0A17 Repeater TX Hold=0D=0AAnd more!=0D=0A=0D=0AYou can =
do most things right from the mike such as:=0D=0Areverse offset, change po=
wer setting, change=0D=0Afrequency, direct enter a frequency, move=0D=0Amem=
ory to VFO or VFO to memory, turn off squelch, go=0D=0Ainto Function mode, =
start scanning, stop scanning, go=0D=0Ato call channel, scan call channel a=
nd another channel=0D=0Acontinuously, change the dual bands to VHF & UHF or=
=0D=0AVHF and VHF or UHF & UHF.=0D=0A=0D=0AYou can listen to AM and hear ai=
rcraft communication.=0D=0AI can pick up several airports and lots of "jet=
=0D=0Achatter" in a 50 mile radius of my car. I can pick up=0D=0Amaritime c=
ommunication no problem.=0D=0A=0D=0AThere is a simplex indicator mode which=
starts=0D=0Aflashing if a station is within simplex range (when=0D=0Ayou a=
ctivate it).=0D=0A=0D=0AThe CTSS decode works very well while repeater=0D=
=0Asurfing. If you hear a repeater just press the tone=0D=0Abutton for a se=

cond and CTSS scan kicks in. It goes=0D=0Athrough the PL tones and beeps an=
d flashes when it=0D=0Ahits the correct one. If the station stops=0D=0Atran=
smitting the CTSS scan pauses and waits for the=0D=0Astation to transmit ag=
ain. This means only one pass=0D=0Athrough CTSS is needed to find the right=
PL.=0D=0A=0D=0AProgramming memory:=0D=0ASet the channel PL offset etc. on =
VFO mode then hit=0D=0Athe function key. The memory display pops up and sho=
ws=0D=0Aa solid triangle next to the memory number if the=0D=0Amemory is oc=
cupied. It displays an empty triangle if=0D=0Athe memory is not occupied (t=
his prevents overwriting=0D=0Aoccupied memory as I used to do many times wi=
th the=0D=0A733). Hit memory on the mem number you want and your=0D=0Adone.=
Much improved.=0D=0A=0D=0ATo give that memory a name - display the memory =
number=0D=0Ayou want and hit the menu key. Stop at the memory menu=0D=0Aopt=
ion and select name. Enter the name and hit set=0D=0Aetc. The name is progr=
ammed in. Its intuitive (at=0D=0Aleast for me). I have done it while drivin=
g.=0D=0A=0D=0AThere is a memory lock out that allows the scan mode=0D=0Ato=
=0D=0Askip a memory. In case you have a repeater where a=0D=0Ablabber mouth=
wont shut up. The radio is simple enough=0D=0Ato do all this=0D=0Awhile dr=
iving.=0D=0AOne feature I like is -=0D=0AIf you were in scan mode when you =
turned off the rig.=0D=0AWhen you turn the radio on it jumps right back in=
to=0D=0Ascan mode! SCAN is fast. It looks like the thing is=0D=0Ascanning 7=
to 10 memories a second. Scan is either=0D=0Astop on carrier or stop for a=
few seconds. You can set=0D=0Aeach band differently if desired. You can se=
t 2 upper=0D=0Aand 2 lower scan limit ranges for each band. I=0D=0Asuppos=
e you could scan 144 to 148 then jump to 150 to=0D=0A154 mhz with the secon=
d set of limits. I have not=0D=0Aneeded or used the second limit. You can a=
lso scan a=0D=0A"call channel" and another channel on each band. The=0D=0Ad=
isplay looks pretty busy when all the scans are=0D=0Agoing.=0D=0A=0D=0AVisu=
alScan: I don't see what good this is. So I can=0D=0Asee there is activity =
on near by frequencies. What's=0D=0Athe big deal I still have to scan them.=
I just don't=0D=0Aget why they went through all the trouble.=0D=0A=0D=0AMU=
TE mode is missing.=0D=0AKenwood for some reason left off the MUTE mode on =
this=0D=0Aradio. Its on the 733 but not the TM-V7A. This is the=0D=0Aonly c=
omplaint I have. I would not be shocked if later=0D=0Amodel have mute. The =
mute key is unassigned on the=0D=0Amike and probably only needs a software =
change to=0D=0Awork. If you want to express your Joy about this to=0D=0AKen=
woood they can be reached at 310639-5300 when the=0D=0Atalking computer chi=
p answers (to tell you what a=0D=0Avalued customer you are) hit 2 then 6 OR=
e-mail=0D=0AKenwood at cuyeda@ix.netcom.com They are slow to=0D=0Aanswer. =
Despite missing mute I have learned to adjust=0D=0Athe volume controls and =
am not going back to the 733=0D=0Athat's for sure.=0D=0A=0D=0AThere is no w=
ireless memory transfer to another like=0D=0Aradio. Kenwood says there is s=
oftware coming to do=0D=0Athis.=0D=0A=0D=0AMODS:=0D=0AThere is a Mars CAP m=
od for Out of band transmit=0D=0Afloating around. Basically you you take of=
f the cover=0D=0Aand snip a wire.=0D=0A=0D=0AINTERMOD:=0D=0AI live in Inter=
mod hell. Being just across the Hudson=0D=0Ariver from New York City there =
is a constant assault=0D=0Afrom the building top antennas. I own a Yaesu FT=
-50R,=0D=0AKenwood 733 and Kenwood TM-V7A. The Yaesu when hooked=0D=0Aup to=
a roof antenna is almost unusable on some bands=0D=0Adue to the Intermod. =
I ended up buying a $66 notch=0D=0Afilter from PAR. That eliminated 98% of =
the problem.=0D=0A=0D=0A The TM-V7A has an "anti intermod" mode. The=

=0D=0ATMV7A is better than the other 2 rigs. But it still=0D=0Agets blasted=
when I'm in the city. Just outside the=0D=0Acity I get almost no Intermod=
but if your looking to=0D=0Atotally eliminate Intermod with this radio you=
are=0D=0Agoing to need a notch filter.=0D=0AThe Antenna connection is a si=
ngle PL259 with an=0D=0Ainternal duplexer (or is that a diplexer).=0D=0AWHA=
T I DON'T LIKE=0D=0A1) while programming the radio from a menu you have to=
=0D=0Apick a selection in under 10 or 20 seconds. What's the=0D=0Ahurry? Th=
ey could have left a little more time for the=0D=0Adriver to decide. 2) Mut=
e and wireless transfer were=0D=0Astupid features to leave off the rig.=0D=
=0A=0D=0AIn reality this is a very easy rig to use while=0D=0Adriving. Its =
full featured and glitch free. You don't=0D=0Aneed a=0D=0Amanual (once you =
spend a little time with it). I will=0D=0Abe picking a second one up for ho=
me use (when $$$=0D=0Apermits it).=0D=0A=0D=0AI am using the detachable dis=
play. The cables from the=0D=0A733 work on the V7 but the V7 cable kit came=
with a=0D=0Aplastic holder you click the display in. When you want=0D=0Ato=
remove the display you just unclick it from the=0D=0Aholder. Its easier th=
an the 733.=0D=0A=0D=0AThe TM-V7A has LOTS more heat sinks inside and outsi=
de=0D=0Athan the 733 has. The mod for Mars Cap is just a snip=0D=0Aof a wir=
e. Audio reports have been very good.=0D=0A=0D=0AI like the refinements on =
the V7A I miss mute but I=0D=0Aaint going back to the 733. I am considerin=
g buying=0D=0Aanother for home as a replacement for the 733 at home.=0D=0A=
=0D=0AI encourage your to write about what you like and=0D=0Aespecially wh=
at DON'T LIKE or would improve on your=0D=0Aradio. The corporate adds only =
tell good news about=0D=0Azillions of features - not how impossible they ar=
e to=0D=0Ause. Few of us want to buy the 100+ page manual to see=0D=0Awhat =
we are really going to be working with. On=0D=0AInternet we can read what r=
eal hams have to say not=0D=0Awhat a magazine that's trying to sell adverti=
sing has=0D=0Ato say.=0D=0A=0D=0A=0D=0A73,=0D=0A=0D=0A=0D=0A =

I have an Alinco DJ180TH and an Ten Tec 2m amp running off of 4 15.0 ah batteries in parallel.

I also have been given a car battery charger at the local Wal Mart (no, it is not automatic), and I was wondering when I can tell by voltage or other means when the batteries are fully charged, or when they need charging. Will the batteries read at so many volts when fully charged?

Tnx.

3032. Kenwood TM-V7A Packet Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-04 00:00:00 UTC
From: rlubash@poco.mv.com
Message-ID: <E53nDA.I74@mv.mv.com>
Source record: 184091

I just picked up a Kenwood TM-V7A which appears to be a great rig. But.. When trying to use it on packet I am experiencing a weird problem. I have a FT-2500 that I have been using for packet and it works with no problems. When I switch it for the TM-V7A I am able to receive packets from the DX cluster and BBS but when I try to connect, the V7A has to try many times and then usually times out shortly after establishing a connection. If it does establish a connection it takes *many* tries to transfer data and usually ends up by timing out after a few minutes. It appears as if the Packet station is not copying the V7A. I have even tried to increase the TX delay on the software (PC Packratt for windows V2.0) and this helped a little to establish contact but still can't stay connected

I have triple checked the wiring and it is hooked up to the 1200 baud RX output/TX audio in /and PTT as it should be. Since it copies received packet information to the computer I assume the receive audio is getting to the PK-232MBX TNC successfully. I have listened to the transmitted signal of the V7A on my HT and it sounds good. I have also adjusted the audio drive to the V7A to make sure it is not over driven or not receiving a high enough afsk signal. I also have made sure the software selection on the rig is set to 1200 baud.

All in all everything seems to be hooked up and set up right. If anyone has any experience with the TM-V7A and digital use that can give me some insight on this perplexing problem I would sure appreciate it.

Thanks and 73

One thing I am curious about on this radio is the new ICOM ad campaign regarding "PC Ready" If you look at the fine print in the ad for the 756, it says optional CTR-17 required. Does this mean that any radio with a CI-V interface is "PC Ready". My definition of PC ready is some sort of RS-232 jack on the back. Is the fine print wrong or should I think that PC Ready means you need to buy/build a level converter for it to work. I guess my IC738 (which I love) is also "PC Ready", but so is every ICOm radio for the past 5 years. Oh well, perhaps this is simply a response to Kenwood's new interface.

Hi Bob,

Dial up the two freqs you want to do the crossbanding on, set the power, ensure offsets are on/off as appropriate, then....

Turn off the radio, press and hold the rpt button while turning the radio back on. To turn off xband, turn off the rig, and turn it back on while holding the RPT button again. Be sure to disconnect the mic as it is live when xmiting.

I have a Compaq Presario CDS 520, with built in color monitor, 66Mhz, 486, 14.4 modem, communications software, etc. Can throw in some very good investment software, and even a virtual reality golf game. For that matter, we have a little company that deals in junior golf equipment, so if you need clubs for your kid that could be added.

Would like to trade this for your solid all band transceiver, for example Kenwwod TS-820, TS440, Yaesu FT840, etc. or a very good receiver, but preferably a transceiver.

My son and I are new to Ham radio so we welcome any advice. Feel free to send private e-mail to walker@rolnet.com

And now for my addition

Thanks, Ted. I am sighted, but prefer lynx for many things. My
experience with graphical browsers is that they are fine for high speed
connections, but grat too it us grafix are a real pain. I am after
information, not someone else is idea of art. Maybe that is why I prefer
command driven systems to gooey interfaces.

3045. Newbie question regarding handhelds

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-04 00:00:00 UTC
From: Scott Anderson <scotta@hunters.com>
Message-ID: <32F7BD28.4866@hunters.com>
Source record: 184104

Hello Everyone,

I have a little bit less than zero radio experience, but I have a quick question.
I am interested in buying a high quality handheld radio that I can have programmed
for GMRS since I can easily (very) get a license. I would be using the radios on
a ranch to stay in touch with other employees.

I have looked at the Vertex (Yaesu) and the Visar (Motorola), as well as many other
brands. The Vertex is a 5 watt unit, while the Visar is 4 watts, I am considering
these over the other brands because of the higher wattage. Is this important?

The terrain I am operating in is steep mountains and hills with some brush but not
a lot of trees. I have been told that VHF would work better, but without getting on a commercial service, or getting licenses for everyone is this even feasible?

I have looked at a lot of radios and would appreciate any advice anyone can give
me! The bottom line is to get the best reception over the greatest distance.

Thanks in advance,

Scott Anderson

Be careful about using copper or aluminum as both have a high
coefficient of expansion and may de-tune under temperature changes.
Commercial-grade cavities are constructed out of mu-metal (spelling?).

> Pretty soon the Icom 708 will include the "TRICORDER" from STAR TREK.

The info I got on the IC-708 came from a usually reliable source. No expresso makers, DSP, GPS, or any other improbable features. What I did here: Two filter slots (already available on the Alinco DX-70 series), 70 cm coverage, improved receiver, most of the bugs of the IC-706 worked out. This sounds reasonable to me.

I have no solid info on the rumored Yaesu or Kenwood rigs, BUT, in this month's Practical Wireless (the British ham magazine), the add for the DX-70TH from one of the dealers announces a DX-71, coming in June, with no specifics.

I think I have the same article, But It would be much the same for most
SSB rigs. once the xtal frequency is ascertained, the rest should fall
into place rather easily.

What modle is your Johnson rig? I have a few CB-10 articles on Johnson
rigs..

I worked at WCSN in Maine (500 kW short wave station sponsored by
Christian Scientists) helping to put that station on line intially. We
used infra-red imaging as you describe to detect poor
joints/connections. Used a vcr to record the readings for later
evaluation. You truly have to see it work to believe it. However, like
most work related to REALLY high power stations, it was not cheap!

tgold@microvst.demon.co.uk ("Anthony R. Gold") posted this in
rec.radio.amateur.equipment:

"I'd like to try using some form of thermal imaging equipment or night-
"scope to examine antennas, feed lines and connectors at night for hot
"spots. Can anyone suggest where to look for economical kit to do
"this? It need not be either very sensitive or very portable. My
"thought was to crank up a few hundred of watts of carrier for a few
"minutes and then check out the system against a cold night sky.

"Has anything like this been tried or discussed before?

"Regards,
"--

I wanted to buy that radio at Dayton last year but I could not find
the radio equipped with the FTT-12 from any dealer. They wanted you to
buy the radio and pay $60 later to get the module. I wanted the PL
decode. I guess it took 9 plus months for them to get it working.

Now THATS the spirit I looked to catch when I started this thread!
I love to tinker... and I'm not exactly a sluff at electronics.
THATS why I got into this hobby! I want to make contacts and have FUN
with something that I have built with my own hands... not just something
I've bought with my own money! Call me an old fashioned newbie (if
there could be such a thing), but that's the spirit of amateur radio I
remember as a kid!

And wouldn't we all love to be a kid again?

But back to my original question...
Does anyone have any information, WWW or printed, that I could use to
convert my old 23 channel Royce 640 SSB CB? Hell, I know it's only five
watts... but it would be FUN!!!

73's,

3064. FT-50 MOD not working

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-04 00:00:00 UTC
From: Mark Watson <marko64@talon.net>
Message-ID: <32F70038.629B@talon.net>
Source record: 184192

Hello
I performed the mod to open cell coverage on my FT-50 and it didnt work.
I supposedly have a model that can be modded accoring to the
serial number... Does anyone have any suggestions?? The mars/cap
mod was done prior to me purchasing the unit.... Any help would be
greatly appreciated.. Can anything be done thru the programming soft-
ware??

THanks

Cross-posted to: uk.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.equipment

I'd like to try using some form of thermal imaging equipment or night-scope to examine antennas, feed lines and connectors at night for hot spots. Can anyone suggest where to look for economical kit to do this? It need not be either very sensitive or very portable. My thought was to crank up a few hundred of watts of carrier for a few minutes and then check out the system against a cold night sky.

Has anything like this been tried or discussed before?

Regards,

>800Mhz... ??
I guess you cannot, as the spec's say there is no 800 MHz possible with these
units. What is it then you do not understand?
Still: I have seen some 79-A's advertised with 800 MHz... I'm no exeprt on
these. Maybe anyone who has actually done the mod can tell?

I checked mine. I do have the 78056GC-016 processor: the one with 800 MHZ :)
It works.

A friend of mine who's doesn't carry this newsgroup has asked me to post a want ad for him.

He's looking for any used dual band HT with the 2 Meter (144-148 MHz + MARS) and the 1.3 Meter (222-225 MHz) bands in it. He's willing to pay upto $300 depending on condition, quality, features, battery, accessories and other variables.

He prefers that you be in Los Angeles or at least in Los Angeles County since he can't travel further and doesn't trust in private deals made thru the mail.

The only HT I know of with both of those bands is one made by Standard a few years ago, but he thinks there may be other brands that do too... I wouldn't know since I'm not into 1.3 Meter.

If you have one he might be interested in call Jonathan at:

1-310-719-9119 (voice mailbox)

Or write him at:

This is a real-time analog spectrum analyzer which covers 100kHz to 1200mHz with a variable persistence CRT. The RF section is a 8554L and the IF section is a 8552A. This is a piece of quality HP equipment which sold new for over $12,000. It is in working condition and the manuals are included. I'll start the bidding at $250 plus Mail Box Center packing and shipping charges. Bidders from the 48 states only please. Offers will be accepted until next Friday 2/14. The unit is in no.VA (ZIP 20170) and the shipping weight is about 75lbs. Please forward all questions and offers to my home at: radiodale@dclink.com

Thank you,
Dale

The manual says the spread is only 1 MHz or so. I've stretched them a
little farther but you'll never get them to 15 MHz.

Buy another one, they're cheap :-)

Guess thats what all those carriers were on top of VK0....

Maybe infrared film for a 35mm camera ? There are "nite scopes"
in the surplus and gun/hunting magazines. They were expensive >$500,
but might be less in the couple of years since I looked.
I had the same brief thought, after reading the postings on trap loss
and poor connections. I'll check some catalogs...One I know of (but of
course can't find just now)is Edmund Scientific...Keep us "posted".

Absolutely.

> i believe you'll find ads in the recent mags for their stuff...

Nope. The company no longer exist at all. There may be other companies that use the word "Palomar" as a part of their name, such as an independant retail electonics store called "Palomar West", but they are not related to the original company.

I wish the real Palomar was still around... I became infatuated with a full-coverage transceiver that they made,(full-coverage on transmit as well as on receive), which transceived from 500 kHz to 500 MHz in 5 kHz steps, built-in automatic antenna tuner,(LED digital readout too), at 50W RMS, 100W PEP, and gave you the choice of either AM, FM, CW, USB, LSB, ISB or RTTY mode with 99 memory channels, ran on any 13.8VDC power supply and was only about 4"Hx9"Wx10"D or so.

It was introduced sometime between 1980-1982 at $599.95 if I remember correctly. I don't remember the model number, but it was in the same catalog as their famous 300A amplifier and other products.

I WANT IT! I wanted it then, I want it now! But unfortunately I've never heard anything else about that xcvr since then. :(

Has anyone else seen any of these or even know what the model number was?

Boy we sure made THEM get their panties in a bunch, didn't we! Heh-Heee!

Their just mad because sometimes we people who have enough sense or who have been in the business and know unfair pricing when they see it won't keep our mouths shut!

By the same pricing methods some of these guys use, my 8088 cpu & amber TTL monitor with 60MB HD should be worth about $1500 or so!

3089. Capacitor in Channel Element

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-04 00:00:00 UTC
From: rjb162@psu.edu
Message-ID: <32f772cb.1220507@news.psu.edu>
Source record: 184217

I have a question about re-crystalling a motorola channel element, nos, kxn1024 and kxn1029 (micor) I know that when you change the channel crystal significantly from waht was in there, you need to change a capacitor in the element to compensate for that change for frewuency stability, etc. Which cap do i change and how do i determine its value?
Thanks in advance
BOB KB8PXI

Droped mine 4 feet on to cement and the battery button jammed. Seems
this is the only common fault with the radio. Badly designed button.

You can set all the information for a channel using the software that
you can set manually from the keyboard.

Carl> Does the software
Carl> provide features that the radio don't have without it?

Yes. There is a published mod using the ADMS software.

Carl> Will
Carl> the software give any control over the radio while it's
Carl> connected (ie scanning, etc)?

No.

Carl> How big is the software and is it DOS, Windows 3.X or

I have the software, and I like it, especially since my wife (a ham also)
and I have identical radios, and want them programed alike. A caution. If
you connect it with the computer on the radio on, or both you can damage
either or both, just as with a printer.
. I knew this, yet I goofed and messed things up. Then the problem
got passed to the second radio. The radios were new, and I wound up exchanging.
Do not make the mistake I made.

3097. were Nicads better in the old days?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-04 00:00:00 UTC
From: boeing377@aol.com
Message-ID: <19970204185500.NAA19488@ladder01.news.aol.com>
Source record: 184225

It seems like today's Nicads give up pretty quickly. I've tried CAP-Zapping and other cures, but usually they are just gone. I have an old mil surplus single cell vented wet Nicad cell (advertised in the 60s in Popular Electronics etc as Nike Missle surplus) that is over 30 years old and still works fine. I know that you can't make a fair comparison between mil-spec and consumer batteries, but 30 years compared to about two to three years makes me wonder about the differences in technology. Anyone else have ancient working Nicads (boatanchor batts)?

3098. Re: Thermal Imaging

From what I understand IR camera film will not work well for spotting hot spots, it is not sensitive to the right wavelengths of IR radiation for heat imaging . What you need is a true thermal imaging system like the Hughes Probe Eye or a military FLIR. Most of these devices use cryo cooled exotic alloy photodetectors and rotating scan mirrors. I have heard that some utility companies use them to image hot transformers and power line leaks. Passive IR nightscopes using standard image intensifier technology will not respond to heat wavelengths with enough sensitivity to be useful for thermal imaging.

Yeah... get rid of it. That model is 100% illegal in the USA because it covers 26.615-28.305 and has FM. They were made by Uniden of Belgium for sale only to certain countries,(and the USA isn't one of them). Get caught using it and the fine is between $5,000 to $10,000!

3100. FT-50R FREEBAND mod problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-04 00:00:00 UTC
From: p22980@email.mot.com
Message-ID: <855080044.13135@dejanews.com>
Source record: 184228

I just made the FREEBAND mod to my new FT-50r (including the mars/cap hardware mod) and now my auto repeater shift (ARS) function does not work, although the menu says it is on. Did I make a mistake, or is it suppose to be gone with this new band plan? I also lost the resistor that I had to remove so it might be difficult to get back to ground zero. What value of resistor was it, anyway? If anyone can help, please email me.
Thanks,
Don kc7qbk

Source record: 184230

If you have the external spare tire carrier on your blazer, then you can add a mount to it. I took a piece of 1/4" thick 2" wide aluminum about a foot long and mounted it vertically behind the spare using two 1.25" u-bolt clamps one on the upper pipe and one on the lower. I then mounted a standard L-shaped antenna mount to the top of the bracket. It looks pretty sanitary since you can't see the mount when the antenna is unscrewed. It also lowers the height about 2' compared to a roof mount. The latch on the carrier has a small diameter rod hooked to the release handle and I just bent it in the center a little to clear the mount and it worked great. I ran the coax down the pipe to the base of the carrier, left a loop for the tire carrier to swing, and then fed it in between the bumper and rear roll pan into a hole below the tail gate. Good luck and 73's

Quite a few Heath HD1410 Keyers show up on this usenet. For about 35 Bucks,
it's a beautiful keyer and it can be modified to run a QSK rig like the
TenTecs. I have been using this keyer and the MFJ keyers for many years.

3110. Ten Tec Corsair II

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-04 00:00:00 UTC
From: Peter Barville <peter@barville.demon.co.uk>
Message-ID: <sR1jTDABb69yEwdC@barville.demon.co.uk>
Source record: 184238

I have been looking at a Ten Tec Corsair II, with a view to buying it. Unfortunately, this particular rig suffers with a problem of non-linearity in the PA and/or driver stage. The 'scope trace on a 2-tone test don't look very healthy (particularly at low level), and reports on the ssb signal confirm this. I have looked at the biasing, but that seems to be correctly set up. I wondered if there might be somebody who has an idea what the problem could be?

The rig delivers the full 100 watts, and so one assumes there can't be anything major wrong with the output stages.

From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <5d89to$ce9@coranto.ucs.mun.ca>
Source record: 184239

I was told that the Radio Shack DX-394 shortwave radio is made for RS by either Sangean or GRE (same people that make the PRO-2006 scanner).

Is this true?

Who does make this radio, could it be Uniden?

Uniden and GRE makes there scanners.

Subject: Adaptor for HT-600

I'm sorry if this isn't the right place, but I'm looking for an adaptor
for a Motorola HT-600's microphone jack. A friend uses it at his
ambulance, but it requires a special "external" microphone. He has a
regular one, however the connections are not "normal". Is there any
adaptor that he can purchase, rather than this special microphone (which
is $75..) for this unit? He has the regular Yaesu type (or Radio Shack
"style") microphone.

Thanks in advance.

Please reply by email (read my sig..)

Marty

Subject: ICOM W32A mars/caps &/or Cell. mod wtd

I have yet to see the modification for the IC-W32A mars/caps up on the newsgroups. I know it's possible, but haven't been able to find any more information on it. Also, when the receive is opened up with the keypad mod, cell is still blocked. I'm wondering if there's a mod to care of this block as well. If anyone has info. on mars/caps and/or cell restore mods, please email me. Thanks in advance.

Subject: PROBLEM WITH IC-2700 HELP!!!!!!

Dear Amateurs

I have a few problems with my IC-2700 dual band.

In the beginning during power on , it used to transmit for a few swconds
by itself.
Then the PTT (of the microphone) could not be recognised if it was
pressed or not , and some times the mic. worked but with alot of noise.

Lately after 3-4 min. of operation(receiving) it starts scanning by
itself all of a sudden.

I have removed the front face-plate and resoldered all the connections
but the problems still exist.

Any suggestions will be appreciated.

Thank you in advance

I'm also looking for a mod. I'd like to get the radio to mute both bands on
transmitt. Currently, even with sub-band mute on, the sub-band rx audio will
come thru when you are transmitting on the main band.

I've already done the transmitt anywhere mod (i.e. cut the green wire loop on
the control board behind the front panel). I don't know if that also opens up
the rx width? Anyone know?

Steve.

FS: Icom 775DSP $2,950

I ship.

No COD's, Send Certified Check or Money Order, since I hear on the news groups people have problems receiving the COD and that a bad personnel check could be used for payment.

IC-775DSP: $2,950.00 with no Filters.

The radio is in New/Mint condition no smoking and always covered.

This is installed and is included, CR-282 High Stability Crystal Unit Contains a Temperature - Compensating Oven Heater and Crystal Unit for improved Frequency Stability, + or- 0.5ppm (-30 to + 60 degrees C or -22 to + 140F)

If you want Filters pick the ones you want and add to the $2,950.00.

9Mhz Filters
$75.00 FL-101: 250 Hz / -6 dB CW Narrow)
$50.00 FL-102: 6.0 kHz / -6 dB (SSB Wide/AM Med. /FM Narrow)
$60.00 FL-223: 1.9 kHz / -6 dB (SSB Narrow)

455 kHz Filters
$150.00 FL-53A: 250 Hz / -6db (CW Narrow)
$150.00 FL-222: 1.9 kHz / -6 dB (SSB Narrow)

All Original and no modifications done by me. Icom Modified the back lighting and the AGC that was reported in the QST tests.

Original Box and Manual.

Reason for selling; use very little and more radio than I need.

Radio can be seen at: http://icomamerica.com/amateur/hf/

Specs. Below from the Icom page.

Pull Out Those Weak Signals with ICOM IF-DSP!

Dimensions: 16.7 (W) x 5.9 (H) x 15.4 (D), 36.8 LB
DSP (Digital Signal Processing) TX/RX
200 W Stable Output Power (SSB/AM/FM/XCW/RTTY)
Built-in Heavy Duty Power Supply
Fully Adjustable DSP Noise Reduction
Level/Width Variable Noise Blanker
PSN Modulation

Audio Peak Filter
Dual Watch (2 Receivers)
Dual Tuning Knobs
Twin Pass Band Tuning
Power MOS FET PA Section
Electronic Keyer
Memory Keyer
CW Pitch Control
CW Reverse
Two Key Jacks
Large, Easy-to-Read Display with Amber Background

I like mine a lot. The device is an amazingly good value. Mine says made in Germany which is pretty unusual for inexpensive electronics. The software loads and runs flawlessly on a 386 or better. My hope of getting it to work on my old 286 portable hasn't worked out. It loads and all the displays come up in Windows 3.1 but the actual waveforms won't show and the screen commands won't work on the 286. If anyone gets this running on a 286 (Toshiba 1600 with Windows 3.1) let me know. This would be a great use for old cheap laptops. Knowing Radio Shack it will soon be on sale for 69 or 79 dollars.

From: sharuck@olympus.net
Message-ID: <5d6kia$q41@hoh.olympus.net>
Source record: 184286

Am interested in your evaluations of HF antennas of the screwdriver variety.

Have seen the DK-DX from H. Stewart Designs, Oregon City, OR, and the BB-3 from TJ Antennas, Hermiston, OR (competing neighbors?) and understand there may be others competing to be the best.

Want to mount a Kenwood 50S with it but want to avoid the "wish I had bought the best of the bunch" syndrome, and subsequent breaking the bank to do the installation right.

Can you help with non-seller advice.

Thanking you in advance, 73, Chuck N7LXO

I'd love to know about a keyboard mod.....I tried the resistor mod
and my 800 mhz wasnt fully opened up.... The software I have is
windows 95 compatible and I think there is a disk for dos or win 3.
versions too.....i've used it only once.........

mark

I had a magazine {book} that i believe had pictures and reviews of
70's and 80's ham radios. I believe they where a compiled from QST but
not sure. They later came out with a volume2 which had later model
radios in it.
What was the name of this book and,can you still buy it?

Hello,
to complete my Yaesu FT-901 line I want to buy the items listed below:
Yaesu FV-901 external VFO,
Yaesu YO-901 Monitor scope,
Yaesu FTV-901 Transverter w/ 144/430/50 Mhz module.
All for AC 220 V 50 Hz voltage and w/ manuals.
I need also xf-8,9 hc filter for CW, FT-901 service's manual and FC-902
schematic diagram.
If you can help me please E-mail to: lucadb@tn.village.it
Thanks.

*** See the bottom of this post for the ONLY correct reply info! ***

A friend of mine who's doesn't carry this newsgroup has asked me to post a want ad for him.

He's looking for any used dual band HT with the 2 Meter (144-148 MHz + MARS) and the 1.3 Meter (222-225 MHz) bands in it. He's willing to pay upto $300 depending on condition, quality, features, battery, accessories and other variables.

He prefers that you be in Los Angeles or at least in Los Angeles County since he can't travel further and doesn't trust in private deals made thru the mail.

The only HT I know of with both of those bands is one made by Standard a few years ago, but he thinks there may be other brands that do too... I wouldn't know since I'm not into 1.3 Meter.

If you have one he might be interested in call Jonathan at:

1-310-719-9119 (voice mailbox)

Or write him at:

ke6yzz@christnet.com

On Wed, 5 Feb 1997, Skip May wrote:

> There is a Palomar Company in Southern California that wants nothing to
> do with the old amp company.

If there was, I'd have known about it because I'm in Los Angeles and I have scoured every area code for Palomar from the Arizona to the sea and from Fresno to Mexico... no dice. No other companies using the name Palomar were any relation to the radio manufacturer. I thought I had said this. Anyway, I wish there was still a real Palomar or an offshoot of it for OEM parts and docs, but it's only used and aftermarket parts are to be found anymore. And forget about 8950 tubes for the Skipper 300 or 6LF6's for the 300A. If you can find them they are probably getting near $1 per watt now,(they're 80W tubes). Better to step-up the cathode voltage to use 20LF6, 30LF6 or 40LF6 which are still usually under $35 each.

As for me, when it comes to amps I'd rather not even consider tubes anymore. MOSFET's are the way to go these days. And they are much more durable than either tubes or bipolar transistors too. The SWR tolerances in RF MOSFETS like those used in JEC's 1-kW are likely to last a decade or two at least with proper use. Who wants to pay ever escalating prices for tubes when you can get better long-term cost-efficiency from MOSFET's?

> Palomar also came out with another radio or two, one being a "Kachina"
>
> It looked a lot like an Atlas in size and construction, but covered
> 25,26,27,28,29,50,51,52 and 53MHz. AM, FM, SSB and CW.

Hmmm... Can you remind me what bands the Atlas did? I remember the name, but that's all.

> I have one, non working and not for sale (I'll fix it some day). I've
> only ever met one other guy with one years ago, also non working.

One would think at the bang for the buck Palomar gave that they'd have
been as big as Uniden at least.

> I've worked on lots of Palomar and PAL amplifiers over the years and have
> one or two around also, can't beat'em for simplicity.

This is true. But you must have a good connection for 100mf 450V filter caps.

> Good luck in your search for "your model".

Thanks. I gather that you don't remember that model I'm looking for. Oh well.

I'd like to add a little more to my posting.

I didn't mention the problem of emissivity. It turns out that you can't tell the temperature of a shiny object. It simply reflects the IR "light" -- or heat -- from its surroundings. You can illustrate this with a simple experiment using a piece of copper-clad board material and a fireplace. Using your hand as a detector, you can reflect like a mirror the heat radiated from the fireplace. I managed to bring a glass of water nearly to a boil with a crude curved reflector made from board material placed in front of a fireplace.

The longer the wavelength, the shinier things get, because the imperfections are smaller in terms of wavelength. (There are also other factors which affect emissivity.) At 10 microns, a copper clad board looks as shiny as a mirror. Most metals have a low emissivity, i.e., they tend to reflect rather than emit heat. In general, dull black things have high emissivity.

If one object has a lower emissivity than another, it can appear cooler when viewed than the other object even if it is much hotter. So a black plastic trap might appear to be much hotter than a metal-covered one even if it were in fact much cooler. Quantitative temperature measurement systems have to correct for emissivity (and accuracy gets poor for low-emissivity objects), or the objects to be measured are coated with a black material to make the emissivity high and uniform.

Source record: 184053

Hello, I have for sale the following 2 itmes:

ICOM IC-27H 2 meter 45 watt mobile radio. Radio has 9 channels, 2 vfo channels, ctcss encode. Has memory, vfo, and priority scan. DTMF Microphone. Radio does show use and has a slight rx problem--when you turn the radio on it will buzz after a few minutes and then the buzz will go away after a couple of minutes. This buzz will not happen again until next time you turn it on.
Asking $150.00 or best offer.

KENWOOD TH-78A dual band ht, Radio has problems with ptt, I tried fixing it but I think the whole board the ptt switch is on needs to be replaced. Ptt still works but you have to push it right. Radio works fine on a speaker mic. Also shows some use. Comes with the BC-15A rapid charger, 2 periphex batteries (12 volt battery, and 1 1200maH battery) also original battery. Also has speaker mic, carry case, and wall charger.
Asking $250.00 or best offer.

I can be reached at 1(816)429-3791 evenings on weekday or all day tuesday and thursday--not here on weekends.
Email (mwise@iland.net)

Hi folks...

I am looking for any brand of 2 Meter MULTI-mode MOBILE transceiver in working condition.

I need it to be made before 1990 but after 1980. I also need it to have at least FM & USB modes, at least 16 memory channels,(including any call and/or priority channels), with the ability to store different CTCSS (or "PL") tone encoding info independantly for each channel and to DTMF tone encoding so I can use it on repeaters, auto-patches, etc. The FM RMS output should be at least 20 Watts when set to maximum output and no less than 2 Watts on minimum FM power setting.

You may name your price, but for a radio that's a simple multimode mobile,(not one of these new models that make a super-computer blush), with at least 7 years of mobile wear and vibration and has endured God only knows HOW many "golden screwdriver" attacks and/or hours before you realized the SWR had gone up for a while after something happened to the coax or antenna,(as is normal in the life of a typical mobile rig), don't expect me to pay more than a maximum of $320 for a 1989 model,(with the maximum being $12 less for every year older than that).

BTW... Being that I am a private radio service technician, I do know what the fair market values on radios are after they've had X number of years of depreciation and I do know how to look up the true year the unit was made, (just so you know before you quote me a price or an age).

There really is no LEGAL way to jam their equipment. The only thing
that you could hope to do is cause severe RFI but then it would mean
that your equipment is not operating within accepted parameters.
Your best bet is to TALK to your neighbors. Be neighborly! It sure
can avoid problems.

Kevin, WB5RUE

It's a possibility to get into the speakers with large amounts of
power on HF bands, etc.. however, I think the easier route would
be to file a noise complaint.

> Twins. Jeff

Jeff,

Although all my rigs are currently fully solid state, I've owned a
number of hybrids over the years. Here are my personal favorites, with,
IMHO, excellent receivers, which rival even some of today's rigs:

Kenwood TS-830S
Yaesu FT-901DM/FT-902DM
Tempo 2020
Yausu FR-101D/FL-101 twins

The Kenwood TS-830S and Yaesu FT-902DM are of a later generation, and
have the WARC-79 bands (12,17,30 meters). The FT-901DM has a kit
available from IRCI (International Radio in Fort Pierce, Florida) to
retrofit it for 30m transcieve, other WARC bands are not possible
without major surgery.

The Tempo 2020 is the oldest of the lot, and carries the lowest price
tag, since few newer hams know what the rig was, or how good it was.
The 2020 was manufactured by Uniden, uses 6146s in the finals, and has
an 11m receive-only band position, which can be fairly easily modified
for 12m transcieve, using the 10m band pass filters. It also covers the
15mhz SW broadcast band.

The only sweep tube rig I listed is the FL-101. The FR-101D is a
matching digital, solid-state receiver that covers 10-160 plus all the
popular shortwave bands, and had optional 6 and 2 meter converters. It
can cover the WARC bands by adding crystals and using AUX bandswitch
positions. The FL-101 also has sufficient AUX positions for the WARC
bands, and the FT-101 WARC kit from IRCI will work in it, though you do
not have to add the extra switch that was needed in the FT-101, thanks
to the extra bandswitch positions. Generally, I hate sweep tube rigs,

but I'll make an exception for these... they were Yaesu's
top-of-the-line rigs in their time.

The transciever that most closely matches your twins is the Kenwood
TS-900, both in appearance and performance, but it is quite rare and
hard to find. I've never owned one, so I can't give you an honest
evaluation.

Hope this helped, and wasn't too long-winded.

73,
Martin

I'd like to buy any of the Icom bookshelf VHF/UHF portables, any andy matching accessories, including power supplies, amps, mounting brackets, etc... The above models are preferred, but I'd take any of the following, provided they are working and in decent shape:

IC-502
IC-502A
IC-202S
IC-202
IC-215
IC-402
IC-20L
IC-30L
IC-50L
IC-3PA
IC-3PS
MB-2

If you have any of the above, please e-mail me with price and condition.

The IF-10B is very difficult to find and worth quite a bit when you do. The two CW filters will cost your around $140 used and the SP-940 speaker comes with switchable audio filters and goes for around $150 when you can find them used.

So while a really clean 940SAT usually goes for about $1100, those extras can reasonably take the price up into the $1450 range. If the rig has a high serial number, the seller might be able to get his asking price. More than likely, though, he may find he has to come down closer to $1250-1300 for a quick sale.

I beleive that broadcasters sometimes use that technique to check
transmission line, especially rigid line which can wear out and arc at
the splices due to thermal expansion.

>Thanks in advance
>BOB KB8PXI

The capacitor is chosen to compensate for temperature change. That is
why they are TCXO's.

Generally you would request the crystal manufacturer to provide a
conpensating device (capacitor or resistor) with the crystal. You
should expect to pay for this service.

You could also send the element in for re-crystal-ization. Bomar and
Internantional Crystal will do the whole works for you.

I don't know of any way to determine without experimentation.

If your blazer has a roof rack, you are half way there. Buy a peice of aluminum angle stock from Home Depot or builders Square. Cut a 6-8" piece and drill a hole in the middle of one side for the antenna mount. On the other side of the angle stock cut a notch about 3/4" from each end. You can then attach the mount of your choice (nmo,etc.) to the bracket. The notches allow the sliding tie down points on the roof rack to clamp the bracket to the rack. Rg8x cable easily fits between the back hatch glass and the roof edge. I recommend soldering a short piece of 18awg wire to the antenna mount and put the other end under one of the roof rack's mounting screws to assure a good ground.
That describes the mount on my 95 Jimmy (same truck). It has worked very well with seleral different antennas (larson,comet,homebrew) I believe this is superior to a glass mount antenna because of the low cost, ease of construction, flexibility (use any antenna). By the way, if your angle stock is not to big the whole thing is barely visible as it is on the inside of the rack. If you need to carry something that takes up the whole roof, just unscrew the antenna from the mount and leave the bracket attached.

Just my two cents worth.
If you decide to build it, let me know how it works out.
Maybe I'll see you driving around town !!

Not forgetting that if someone has not used IR film before, then it's
essential to RTFM; there are also less obvious differences between different
makes and types than with ordinary film.

>-Paul C. KG0CZ

I was able to repair my FT530 for a break in the connection to the BNC originally. However, I had the factory do a out of warranty repair for intermod later. They solder in new components and additional shielding that would make it difficult to remove the next to the last board to get to the connection. IF you do attempt the repair I suggest that you use coax braid to form a flexible connection to the BNC.

Western Radio of Kearney, Nebraska used to advertise a little one-tube transciever in the back of electronic magazines like Popular Electronics in the late 1950's. It operated on batteries and worked on 40m and 80m CW.
I had one of these little gems but lost it over the years and would like to find one again or even literature or an ad for one. Please drop me email if you have any info on this little rig. Front panel was approx. 5"H x 8"W.

I >guess my IC738 (which I love) is also "PC Ready", but so is every ICOm >radio for the past 5 years. Oh well, perhaps this is simply a response to >Kenwood's new interface.

I think what ICOM is trying to do is alert the owners of ICOM equipment that the radio can indeed be itnerfaced to a PC. Many do not understand that the radio can be connected to a computer. Also do not over look the fact you can daisy chain several ICOM radios together on ONE serial port, and control each seperately by merely changing the radio address. This is something you can NOT do with a Kenwood or Yaesu, If ICOM stuck a serial port on each radio then you would have to dedicate one serial port on your computer for each radio you desire to control.

ICOM's CI-V system is unique, but TenTec and Opto-Electronics copied it and are using the CI-V system on their equipment.

Hi Tony,

The high-tech low cost method would be nightvision equipment that you rent;
however access is low and cost still remains high. Film on the other hand
allows you to work at our traditional one Ham Time Unit (the time it takes
to complete any task).

Try Kodak "High Speed Infrared 4143 (ETB)" or
Kodak "High Speed Infrared 2481 (ETB)"

Both come in 35mm rolls of 20 exposures. In conventional lighting, the
film speed is roughly 50 daylight or 125 Indoor. However, for your
purpose, you throw these numbers out the window because they relate to
visible image sensitivities. At Kodak's suggestion they specify the IR
exposure sensitivity with: "find exposure and developemnt changes for
reciprocity effect by experiment"

The problem of exposure time for IR is hard to judge by view (by
definition, much less age). A simple survey might include:
1) place camera on tripod in field, allow camera temperature to come to
ambient (better yet keep all components in cool to cold storage).
2) You or station operator should find a quiet spot on the band and
announce to the world you are about to change that status.
3) Key Down
4) Hams have an inner sense of timing in these matters and you will find
that as you juggle the trade-off of melt-down or FCC violation, your hand
reaches for the shutter and:
5) Using the Bulb shutter extension (a cheap and valuable tool) you squeeze
open the shutter and begin to count. 1. 2. 3. ... 10214. You are

begining to hallucinate about the FCC melting down now, when your thumb slips...
6) Key Up
7) Burn up the roll man! Before the FEDs show up; this is your last chance to catch that cherry red glow. You can take one more shot, for the same time as the first, or split that time for shot 2, and split the time again for shot 3, and split the time (you catch my drift)...

The difference is having perhaps two seriously overexposed pictures (exceedingly unlikely), two correctly exposed pictures (also unlikely) with 18 blanks following; or a lot of pictures of varying exposure, one of which is very good.

This splitting of time by half allows you to move the film's exposure curve into the linear region for developing an image. Another consideration is don't expect image clarity. Even with a perfect focus, you are out in palookaville to IR. Translation: serious SWR for this out-of-band application of visual optics. Having the lens wide open doesn't help in this regard, either. If image quality requires Bic fine-point quality against the crayola snapshots you get: expand your film budget and start playing with the lens' matching.

Bob, I haven't been with the company in over two years, but even
as far back as 1995 I was being told BY A BUYER for RS that they had
dual-band ht's and were just waiting for all the testing to be completed
before they went to the stores. I believe this to still be true. The R&D
guys down in Fort Worth(less) did have a tendency to want to check and
re-check their previous re-checking that they had done all the checks
right before releasing anything. The thing that gets me is that they never
have come up with a nice (inexpensive) mobile companion to the 202. Their
HTX-212 is now becoming affordable but its just because the 242 came out
to replace it.

You have 4 wires/0ohm resistors that can be moved for different
modifications. I think you can use these tochange the 733A into a
733E, but I don't remember which configuration you need. (The
resistors/wires are loccated near the top of the board right behind
the front panel.

Maplin do a little CCD camera, intended for security applications, for
120 UKP. It is sensitive in the IR range but the catalogue doesn't
specify just how sensitive.

For 200 UKP, they also do a little non-contact IR probe which plugs into
a standard digital multimeter.

Dunno if either would come into the 'economical' catagory though.

I am looking for any info on QRP UHF wireless remote control and/or headset with boom mic that can be adapted to allow the station operator to roam the immeadiate neighborhood (upto a mile radius) while chewing the fat. It should have at least the headset & mic and preferabley also a control channel thru which you can operate at least the base rig's up/down frequency control if not the entire keypad, and should be able to either wire or plug in to just about any radio.

FOR DIRECT EMAIL REPLIES, USE ADDRESS BELOW...

I have already asked ICOM and am awaiting a reply from their support staff. perhaps someone here has already had experience in this.

My T7A HT does not allow you to transmit below 440 MHz, and I want to be able to go down to at least 435 MHz on transmit so I can work the FM Repeater on MIR (435.950 up/437.950 down). My local HRO store said the mods exist and could possibly be available through ICOM.

So here I wait with HT in hand.....

I've used my V7A on 1200 baud packet with no problems.
I did notice that the SQUELCH feature (I forget the name)
in the unit setup had to be turned OFF and that the volume
had to be turned up higher than on my other rigs.

What I haven't tried is 9600 baud packet.

Hope this helps.

D.Gan KC7NYP

3202. FT-990 relay clicking solved

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-05 00:00:00 UTC
From: mwhite@mitre.org
Message-ID: <mwhite-0502970948340001@m14494-mac.mitre.org>
Source record: 184159

Thanks to all those who replied to my query about spontaneous relay clicking in my FT-990. Turns out it's just thermal expansion of the case. The case on that rig is very tight, and it "ticks" a little as it expands and contracts as the rig heats up and cools down in normal use. It sounds *exactly* like a relay snapping. I found out what was going on when I heard the "relay" still snapping after I turned the radio off!

Mike "egg on his face" N4PDY

3203. Suggestions to Yaesu on the FT-50R

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-05 00:00:00 UTC
From: Mike Richter <mike_richter>
Message-ID: <32f88116.0@139.134.5.33>
Source record: 184160

The FT50 is a great transceiver, but I would like to see some improvements that I have seen in other transceivers or scanners. This is an open letter giving my suggestions on improvements which would make the FT50 able to do what I need.

If you would like to make sure that the next transceiver is closer to your ideal, then let Yaesu know what you want by posting to this Newsgroup or direct to Yaesu at yaesu@yaesu.co.jp

Mike VK2BMM

A REAL Priority channel
I want to hear a call on the priority channel, even if I am scanning all memory channels or a band. The Dual Watch modes are useful, but I really need to make sure that I hear a call on the Priority Channel, NO MATTER WHAT ELSE IS HAPPENING ON OTHER CHANNELS

Selectable Bank Scan
Scanners allow you to scan selected channels in a bank, and I don't expect that from a transceiver. But it would be handy if I could select to scan only on a limited range of channels e.g. 1 to 4 for emergency only, 1 to 17 for high priority etc. If Setup allowed for setting Top Scan Channel (i.e. 2 to 98) then this would be possible. A fast keyboard command would be needed to turn this feature on/off i.e. Off = Scan all channels, On = Scan 1 to Top Scan Channel. Pressing F and 4 would seem to be sensible - I can't see the need to change RX Save too often.

Lockout (skip) nuisance channels
When I am driving along and I get interference on a particular channel, I want to be able to lock it out of scanning by pressing ONE button - not four !!! (MR F MR MR) e.g. I suggest that holding MR while in already in Scan mode would Skip that channel.

Set Skip off for ALL channels.
When I get interference on a channel I set it to Skip, but then I forget which channels are set to Skip. I need to be able to set Skip off for ALL channels with one command.

Less Display Glare problems
It is usually impossible to move the transceiver to a position so that there is no glare from lights reflecting off the curved display cover. The next time Yaesu's designers suggest that a curved display cover will look very stylish, please ask them to use the transceiver in the real world first !!!

Reliable Power On / Off
The transceiver is useless if the batteries have gone flat because it turned itself on in my pocket. The transceiver is useless if I think I am monitoring a frequency, but it has actually turned itself off in my pocket. Please deeply recess the switch and only allow the radio to turn off, OR ON if the button is held down for two seconds.

Better Scanning Mode Display
The blinking Decimal Point is virtually invisible - how about flashing CH on the sub display instead

Easier Scan Stop
If scanning stops on an interesting channel I need to be able to stop scanning quickly. This would be easier if any button (except F) would stop scanning - not just PTT or MR.

Easier Battery Voltage Display
Checking if the external power connection is working while scanning or how the battery is holding up on transmit is a very useful feature but I rarely use it because it is so complex. Turning on DC Volt display and getting back to normal sub display means I have to do FOURTEEN things !!!! (press MR, hold DIAL, turn DIAL, press DIAL, turn DIAL, press DIAL, hold DIAL, read volts, hold DIAL, press DIAL, turn DIAL, press DIAL, hold DIAL, hold MR). How about using F, PWR to turn on DC Volts display for 5 seconds (TWO buttons).

Automatic Mode Changes when on External Power
It would be handy if Rx Save, Tx Save and Lamp Timer were automatically disabled when connected to external power. The DC volts display should also come on for 5 seconds, because there is NO other indication that External DC connection is actually working and charging the battery.

Safer Battery Charger
The manual doesn't tell you, but the diagram shows that the charger is a simple constant current charger. If you connect it up to permanent power for days on end you will overcharge and damage the battery. (You run the radio on External Power and stop charging the battery at full rate by reducing the DC In to 9 volts for the 6 volt pack). A charging timeout (preferably in conjunction with battery temperature sensing) would prevent this problem.

4 Conductor Plug
I cannot plug a normal earphone into the plug. If you had Ring 1 Mic and Ring 2 PC (reverse to current wiring) I would have been able to use a standard Stereo 3.5mm plug and left the Ring Open Circuit. As it is now Ihave to buy a big expensive adaptor just to use an earphone !

3204. WTB: Mic/Earphone Plug for FT-50

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-05 00:00:00 UTC
From: Mike Richter <mike_richter>
Message-ID: <32f884cd.0@139.134.5.33>
Source record: 184161

Does anyone know where to buy just the plug without buying the enormous adapter.

PS - if you want to use a plug only for Mic or Clone then a standard 3.5mm stereo Plug can be modified by putting a heat-shrink collar on it so it won't go in all the way.

The tip then contacts the Clone and the Ring contacts the Mic/PTT. The internal speaker stays on since the plug hasn't gone in far enough. Useful for Ext Mic only !!

Just a thought - if Yaesu had interchanged Clone and Mic then we would be able to use a 50cent plug for earphones or Mics instead having to search for a special plug most probably only available from Yaesu !!!

THe night scopes won't work, as they electronically amplify the visible wavelengths rather than view the infrared wavelengths.

THere are handheld infrared viewers ($500 US) we use with spectroscopy instruments which employ high power NdYAG lasers ....my experience is that is is hard to see KW of pulse energy at 10 Hz. Hands, lamps etc., just don't stand out as hotter than the general background intensity. The view is not sharp, either. THe systems costing $10-50K using false color presentation would be able to do this !

An easier test (with a dipole, say) might be to soak the antenna in cold and measure the end to end resistance. Then, run it at power, and repeat the resistance measurement. If you don't see much change, you have reasonable junctions. Many DMM read down to 10-3 ohm resolution. Copper has a fairly large temperature coefficent of resistance.....

Maybe you can contact KW via e-mail and ask for fax of 733E schematic.
Compare the 4 resistors in the face panel and modify as necessary. Also,
on the Boston Am Radio Club ftp sight, there is a file that is a 732 mod
sheet and contains a chart of 732 model types and the 4 resistors in the
face panel.
Try http://www.acs.oakland.edu/barc/archives.html

I have seen electricians working with thermal imaging equipment. You might just try going through the phone book. IR file will not work, it is sensitive only to the wavelengths just beyond the range of visual light; if your antenna is close to red hot you've probably got more obvious problems!

The Radio Shack HTX-212 will "Receive" MARS and CAP frequencies straight
from the box.
The frequencies can be programmed into either vfo. In fact any
"Receive" frequency from 136.00 -174.00 MHz can be programmed into
either VFO.

The HTX-212 can be programmed to "Transmit" on MARS and CAP frequencies
by holding down the F+DTMF buttons while turning on the radio. This off
course is of no value to those who are not licensed to operate on MARS
and CAP frequencies.

Infra-red is a catchall term that refers to light with wavelengths longer
than we can see. The range of wavelengths in the area referred to as IR is
several decades. The wavelength of light emitted by hot objects is directly
related to temperature. (The width of the emitted spectrum also varies with
temperature.) For example, a "red-hot" stove burner is emitting light in
the visible red spectrum. Turn the burner down until you can't see it, and
its emission is in the "near" infra-red -- the region which IR film is
sensitive to. By the time you get down to room-temperature objects, the
peak emission is around 10 microns, more than 10 times the longest
wavelength we can see. At this wavelength, glass is opaque, so can't be
used for a lens. (Metallic germanium and silicon, which are both
transparent at that wavelength, are frequently used.)

What I'm getting at is that IR film will probably only show you things that
are very hot indeed. A black-and-white closed circuit TV camera with CCD
target, with the IR filter removed, might extend the range some, but I
don't know this for a fact.

I think the best you'll probably do with economical detectors like IR film
or camera is to detect very hot things, and probably not things which are

just warm.

For a while I worked for a company that made an infra-red imager (forward-looking infra-red imager, or FLIR). It was considered quite economical at only $80,000. I'm very interested to see what you'll come up with.

Thanks for the comments. I'm interested in monitoring the condition
of beams and other associated bits and bobs such as power dividers,
baluns etc. These are all up on towers and out of reach and so not
well suited to soaking and testing with resistance measuring
equipment.

I recall a time when electric utilities were offering to come by
one's home and use some kit to detect by imaging any warm areas on
the exterior of the house, such as under-insulated roofs, single
glazed windows and draughts around poorly fitting doors.

This was at a time when oil costs were soaring and the PSC's figured
that it was cheaper and less polluting to reduce a wasted kWH than to
build new plant and use yet more fossil fuel to generate an
additional kWH instead.

Does anyone know what kit the utilities used for this service?

GE MPS 64 channel programmable radio/Convert-a-Com. 136-151 split.
Currently has all Civil Air Patrol channels and many ham repeater
splits.
Also has 4 simplex channels. All channels programmed. Radio was tuned
up and programmed last November. Case is in good condition. 6 Watt
output. Comes with Leather case, new battery, Mike and speaker for
Convert-a-Com. A great heavy duty radio. Programming from a GE dealer
to
your specs will run about $35 or so.

Thanks for reading this.

I have one (1) A&A Engineering Viewport VGA unit for sale. This was purchased a few years ago PRE BUILT BY A&A - It is in very good condition with very little use. It runs off the printer port of your PC, with appropriate software. This is the one by KA2PYJ. It lists for $229 prebuilt, I am letting mine go for $125 or best offer.

I have a Compaq Presario CDS 520, with built in color monitor, 2X CD, 66Mhz, 486, built in 14.4 modem, communications software, etc.

Would like to trade this for your solid all band transceiver, for example Kenwwod TS-820, TS440, Yaesu FT840, etc. or a very good receiver, but preferably a transceiver.

My son and I are new to Ham radio so we welcome any advice. Feel free to send private e-mail to walker@rolnet.com or call the 800 number below.

FOr some reason, this seems to have a cleaner appearance than 11 meters. The UHF, the PL and the fact that it ONLY comes in barely-modifiable ht units all suggest that it may actually work.

No, I got mine the first day that they hit the stores, just under 2
years ago.

The instructions _are_ in the manual. The RX goes the full range from
137-174 MHz, though the TX is more limited to a few MHz outside of the
amateur band. It does cover MARS/CAP, though. Sorry, I don't have my
manual close by, but it is in the, and just involves holding down a
couple of keys while turning the power switch on.

CCD cameras are typically sensitive only to near IR (out to about 1
micron). If you cool them to 77K, you can decent images of black body
emmission from targets that are 400 - 500 degrees C. (Ouch on the old
antenna).

As IR imaging equipment goes, only the 3-5 micron and the 8-12 micron
stuff will see this kind of target. The cheapest new IR gismo I've see
is the NightSight the TI makes for policemen. It is an uncooled 8-12
micron IR imager, and runs about $7k - $8k. The 3-5 micron stuff
usually involves a Stirling cycle cryo-cooler and runs more like $50 k
for a camcorder-like gismo.

I don't know much about IR film, but most glass doesn't transmit 3-5 or
8-12 micron radiation worth a damn, so I'd bet that they are also near
IR.

The IR temperature probe might work, and is probably the cheapest of the
alternatives discussed.

3253. FT-50 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-06 00:00:00 UTC
From: "Allan (VE6AQK)" <doblera@cadvision.com>
Message-ID: <32FAAF32.2486@cadvision.com>
Source record: 183960

Hi, I just bought a Yaesu FT-50. Great little radio. The antenna sucks alright. I have the Windows 3.1 software. When I program the radio from the PC, it does not program the power settings correctly. I can set the low power setting to L1, L2, or L3 but the radio always has the low power setting set to L1 (100mW) after programming. Has anyone else noticed this, or am I doing something wrong? It is rather annoying.

I have done the freeband mod (solder pad and jumper resistor removal). Ser# is 6G05xxxx. Radio has FTT-12 installed. I've seen some complaints of poor PL decode and falsing. Mine seems OK, was there changes on later FTT-12 boards?

Is there a source for those 4 pin programming plugs? I want to build another interface box for use at the office.

I was hoping it would fit into a Visar leather case, but it a wee bit too big. Is there a decent case for it?

Allan VE6AQK

Hi !
During my last vacations in FLA i bought me a 50R HT, pricetag in the US approx. 70 bucks cheaper then here in Germany.
Since i don't care for the rubberduck i bought one of those adapters and used a telescopic antenna with a bayonet connector. However, beeing back home, i got the following antenna from my local ham-shop here in Hamburg/North Germany and i am very pleased with its performance on 144 and 430:

Length: 35 centimeters (approx.)
Material: thin and very flexible, black whip.
Connector: SMA (no adapter !)
Type: Duo-Band (1/4 lbda. on 144, 1/2 lbda. on 430)
Gain: 2,15 dBi
Power (max): 10 Watts
Name: Maldol 'Active Hunter'
Manufacturer: Hokushin Industry Co. Ltd. in Japan
Price: approx. 26 Dollars (42,50 Deutschmarks)
(3.500 Yen printed on package)

Description taken from the package.
Maybe you can order it at your local hamstore.

Hmmm. Maybe they would get the hint? Either that or they would firebomb
your home.

Perhaps they need to be tested as dummy loads for a 25 kW 2.45 GHz amp?

Actually, I have (accidently, really) found that 100 Watts on 450 MHz quite
nicely
disrupts most consumer electronics within about 40 feet. Including the VCR
taping
my wife's soaps...

> Thanks in advance
> BOB KB8PXI

In many of the channel elements, there are a host of capacitors you could change -- a lot of them are in parallel. Usually though, the one directly adjacent to the frequency netting (variable) capacitor will be an OK one to change. (Look at the PC board traces and see if it's in parallel with the netting cap).

If you're moving the frequency down, you'll want to increase the capacitance in the circuit. How much capacitance to use is best determined by experimentation. Try several different values that are in the general range of the one you took out (but a little higher in value) until you find one that tunes the frequency where you want it, with the netting cap near mid-range. This will provide for temperature compensation; if you're tuned at the end of the variable cap's range, the element's frequency may be unstable at extreme temperatures.

I can't seem to find my manual for my radio.

Can anyone tell me which the three keys to punch to set my FT-8500 into cross-band repeat mode? I just got it back from a warrantee repair and it's been so long since I've used it that I've forgotten how to operate it.

Also, I don't know how to make the DTMF decoder work?

Thanks in advance.

Hi Glen,

The current Drake RX, the R8 was tested here by our HAM magazine.
While it has all bells and whistles you may ask for, the strong
signal handling capability was found to quite limited, less than in previous
Drake models and a long way from what can be called "high end".

Why not consider a TRX? Performance wise you tend to get the TX thrown in
for nothing.

Why not try replacing R65 with an appropriate NTC thermister- it probably doesn't carry any appreciable current (glue it to the PA heatsink, of course). Then, in effect it would be temperature controlled after releasing the PTT. (NTC= negative temperature coefficient.)

Source record: 184006
Cross-posted to: ca.wanted,la.wanted,la.forsale,rec.radio.amateur.equipment,rec.radio.swap

Ted:

Are you really that thick-headed? NO multi-mode mobile made before 1990 can independently store individual CTCSS tones for each memory. NONE had more than 11 memories. NONE sell for under $320 that meet your specs. YOU ARE LOOKING FOR A NON-EXISTANT RADIO!

The oldest rig that meets your specs is the Kenwood TM-751A, going price is $500-$600. The only other 2m all-modes ever sold that exceed 10 watts are as follows:

Icom IC-290H - 25 watts, no PL capability at all, going price is really around $350.

Yaesu FT-290RII - current model, only 11 memories, dip-switch PL, used price around $450.

Kenwood TM-255A - current model, meets all your specs. New price is $929, so you can guess what the used price is.

Kenwood TR-9130 - you called it "feature-starved". It sells for about $350.

Ted: THAT'S IT--THE WHOLE LIST. 2m all mode mobiles are not popular, do not sell in quantity, did not have many models made, and, despite everyting you think you know, command a high price. WAKE UP! FACE REALITY! (Are you capable of doing that?)

don't
> expect me to pay more than a maximum of $320 for a 1989 model,(with the
> maximum being $12 less for every year older than that).
>

THEN DON'T EXPECT TO BUY A RIG!

> BTW... Being that I am a private radio service technician, I do know what
> the fair market values on radios are after they've had X number of years of
> depreciation and I do know how to look up the true year the unit was made,

Then I guess you're not thick headed, just deluded. You have absolutely no idea what you are talking about!

Honestly, good luck. I wish you no ill will, and if you really can buy what you want, more power to you.

73,
Martin

3273. Test Gear for sale or trade

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-06 00:00:00 UTC
From: gregg@plains.nodak.edu
Message-ID: <5dcpdd$j3e@daily-planet.nodak.edu>
Source record: 184008

I have some goodies that I'd like to sell or trade.

Tektronix 2235 100Mhz dual trace Oscilloscope, very nice condition, with x10 probes. This is a current model and lists for $2995

3 - Tektronix CFG250 2Mhz Function Generators - Real nice generators, can use second input for complex waveforms, ranges from .2Hz to 2.x Mhz with square, sine and saw waveforms, adjustable amplitude, dc offset, duty, V. output, sweep rate and sweep width, etc. These are small solid state units. This is a current model and they list for $450

3 - Elenco Precision Triple Regulated Power suppies, model XP-660 - bench power supply, not high current, but highly regulated and adjustable voltages. This is a current model and lists for about $500 to $600.

HP Model 200CD Wide Range Oscillator 4hz to 65Khz. I have no idea what this cost new.

B&K Precision Triple Output DC Power Supply 1660 - This has dual digital meters, each switchable between amps and volts, delivers up to 6.5amps at 0-30volts, each output is adjustable for volts and current limiting. This is a VERY nice lab power supply. I don't know if it is a current model or what it cost new, but I'd estimate $400 to $500 range.

Make an offer on any or all of this, cash or trade toward HF gear. I had a friend look these items up in a catalog to find the new prices. I think they should be worth about 50% of new or there abouts. What do you think, too high or too low? I'm interested in your opinion even if you're not interested in the gear.

Source record: 184010

Greetings all. Your collective wisdom please on the following baffling situation. I have a Kenwood TS 850, which has a terrific receiver as you all know. On one band, 75 meters, my s meter indicates a constant S 9 noise level...anytime of day, anywhere on the band. On all other bands, I never see this kind of noise level except under rare solar condx or when some car drives by with ignition probs. I originally figured I had the classic low band noise problems inherent to city living (I live in Seattle), but found it strange that it was limited to 75 mtrs and not experienced on 160 or 40. I even bought an expensive "noise canceller", which did absolutely nothing of significance. Then yesterday, my good friend K7XS brought over his FT1000MP for a comparison test between it and the TS 850. Lo and behold on the 1000MP the s meter registered only s 2 or so. When I switched to the 850, got an s 9 again! We did this switching back and forth several times. On all other bands, the noise levels registered the same on both radios. We then checked sensitivity by listening to the weakest signals we could hear on the 1000MP and then comparing it to the 850. The 850 could pick them up without a problem (sometimes even better than the 1000MP!), despite the s 9 meter reading. By the way, on the 1000MP we had the dsp turned off during these tests. Any idea what's going on with my TS 850 s meter on 75 meters? Your input will be much appreciated. Tnx & 73, de John, K7JY.

The best way to handel that is take your huge speakers with the 13 inch
CV's in them and turn them around facing the wall that they live behind
(provided it's an apartment) and set your timer for one hour after you
leave, crank up that bad boy, get some really offensive rap CD from Death
Row and set it to go off just before you get home from work and that
should take care of that! :)

3279. Collins 32S3 transmitter question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-06 00:00:00 UTC
From: Dan <newbyd@omniview.com>
Message-ID: <32FA0AAB.71B7@omniview.com>
Source record: 184014

I have a 32S3 txmtr that is extremely touchy to tune up on 10m. If it is tuned just right it works fine. But if not, it appers to tune fine in the tune and lock position, but when you switch to either SSB, and key the mic, it oscillates. Giving full power output, no matter where the mic gain is set.

Surely all these txmtrs weren't this touchy. Has anyone actually seen this problem before? If so, what was the cause?

Thanks,

Dan Newby

Hi and thanks for reading;
Does anyone have any alignment tips for the TEK900. The local shop wants $69.00/Hr for alignment!.
I have a TEK900 set for 441.1Mhz. I have injected a 3Khz tone and successfully received it on another FM received. So I think the Tx is OK. However, the Rx is where I have trouble. Will the reverse work?

I have recent access to a FM modulator that can generate toe on FM with varying bandwidth and modulation. I do not have a Spectrum analyzer. So I'm hoping someone with a little experience can tell me if listening on a Radio, while watching a Scope for amplitude would suffice?

Feedback welcome, Gabe Nemeth VE3SLJ.

3281. TM-261 OOB MODS NEEDED

->This is a real-time analog spectrum analyzer

Ok, fellers, this is the same guy that had a Boonton 250 RX meter last week. Doing a onesy-twosie sale on an occasional basis is one thing. My suspect is that this is going to become the weekly auction thing.

Besides, what's this auction crap. Put up a price. First one to meet it buys it.

It can be done, but not with the equipment you are talking about. You
want to look at objects that are *self-luminous* with IR energy. Since
the temperatures you are talking about are somewhere in 0-100 degrees C
and not thousands of degrees C, the IR you need to "see" is very long
wave. You need special longwave IR sensors that are cooled well below
ambient temperature to do this. There are "cameras" that produce images
this way, which are used for looking for flaws in airplanes and heat leaks
in houses. This is the only device that will do what you want.

Most "night scopes" amplify dim visible light, so would be no use at all.
Even infrared scopes see by *reflected* infrared light, using relatively
short-wave infrared light (really, just a bit longer wavelength than
red visible light. These cannot see infrared emitted by warm objects.
Infrared film and infrared-sensitive CCD video cameras are also
sensitive to only short-wave IR light. So to use any of these, you
need an near-IR light source (tungsten lamp, IR LED), and (more important)
things near room temperature will not look any different than they do
under visible light.

> Paul
> VA3MLW

Does the power adapter plug into the battery or into the radio itself?
If into the radio, this may help.

I did a trick to the battery pack on my FT530 because I didn't want
the external supply (over) charging the battery. While I'm not familiar
with the FT50 specifics, I'd bet this can work.

The FT530 battery pack has 3 terminals: Ground, + out, and a charging
input terminal. All you need to do is identify the charging terminal
and block it with an insulating material. For my case, I used a piece
of plastic cut from an overhead projector foil. I clipped it to about
the right size, and cut out holes for the ground and + out terminals so
the battery makes contact with the radio. The charging terminal is
blocked. A little double-stick tape to the battery case holds the
plastic in place leaving no adhesive residue on the terminals. You
could probably do the same thing with tape over the terminal, but you'd
have to clean the adhesive off when you actually WANT to charge the
battery while attached to external power.

Hope something here is useful. Good luck.

When I first turn the radio on the first 30 kHz is dead xmit and rcv.
As the radio "warms up" it slowly comes alive moving down the band.
Actually I noticed this problem on the amateur bands first, but actually
occurs in each 500 kHz segment. Any thoughts before I tear into the
radio.

It is perhaps possible that you could generate sufficient RFI to
interfere with the operation of their stereo (as well as every other
consumer electronic appliance within a wide radius), but besides being
illegal, it would be stupid. Either they, and the rest of your neighbors,
would come over and beat your butt, or they'd just add some simple RFI
suppressors to their stereo and turn it up louder.

It will be much better to deal with the problem in a legal fashion.
If you can't come to an amicable agreement with them, and they really
are playing the music so loud as to be a public nuisance, then file
a complaint with the local police for violation of the local noise
ordinances (almost every community has one). If for some reason your
community doesn't have a noise ordinance, file a civil suit directly.

If you don't wish to involve the law for some reason, then I suggest
you invest in a cheap pair of hearing protectors, available from any
industrial safety equipment supplier, or a shooting supplies outlet.

The 141T is just a display section, and a box for the RF and IF modules.
What RF and IF sections does it have?
Is it 0-1200MHz then the RF section ought to be 8554B, and the IF section perhaps
a 8552A.
I got a full assembly here right in front of me...got it for free at my job...ericsson.
I like it!

Wow, Good luck! While it is true that there is depreciation on items, some things have a decidedly different rate than others, and there is also changing technology that has changed pricing a lot. The fact remains that 2M allmodes are "hot" or strong in the market right now, 9130s and even 9000's bring 2-300, old KLM Multi 2000 and 2700 draw all of that and more, IC211,260's and TS700s still draw 3 bills. Couple that with the fact that "modern" mobile all modes are a somewhat recent development with memories, tones, etc., you may well have to get your thinking up or your expectations down.
Sorta like pickup trucks are right now, A truck that you would have paid a grand for right now is bringing 3, and a really clean example is now "special interest" and gets 5.

Most paging tones that you are describing are not DTMF tones, but
2-tone QuikCall Motorola paging... these tone generators usually are
using commercial type tones, but DTMF, so I don't think this would
help... unless you're talking about another type that I'm not familiar
with.

>5. Power in
> WOuld a simple coaxial dc connecter be too much to ask?

Speaking of power in, for those of you not aware, Radio Shack (believe
it or not) now sells a power adapter that fits the DC in on the
10/40/50R. I think you get like 2 for $.50 or something like that,
which beats paying $11 from a radio store, or $30 w/ noise filter.
This is all I know on this, sorry I can't provide catalog nums, etc.

This is what CB should have been all along, UHF. The people who are abusing the 11m frequencies are not going to be interested in this band because the distance is very limited, and thus the audience small.

In fact CB is pretty decent now, I use it when I travel. The sunspot activity is so low, only local signals are heard, but in a year or two it will be back to its old self.

I purchased the battery shell (the one you load your own batteries in) and made it into a radio mount for my FT-50R.

I attached the battery shell to my CB with a piece of coat hanger (will coat the wire with plastic, or paint sometime) and currently I use a lighter adapter into the external power socket of the radio.

Next phase: run the power into the battery shell, just slide the radio onto it and I am in business!

Also, I replaced the stock antenna with a BNC connector (black heat shrink tubing to make it look cool, O-ring at the bottom to make it waterproof) to use a variety of antennas. In my Jeep I use a telephone wire hidden in the top molding all the way around the head-liner, hooked into a BNC adapter and a piece of coax runs to the BNC connector on the radio. This trick hides the fact that there is a radio in the vehicle from nosy folks (cops and crooks).

Performance on the phone wire antenna is actually too good, I pickup transmissions from way too far away for my immediate interest.

Hope this rambling helped!

I don't think you'll need to spend 50,000 dollars to get the
instrumentation you need. There are hand held instruments, commercially
available that are used often by electric utilities to check power
lines, etc. If you are really interested, e-mail me and I'll send you
some info.

Most silicon based CCD cameras (typical camcorder type) have reasonable
response to 1150-1200 uM. Of course, this assumes any filter used on
the front end are removed. The silicon is the limiting factor. If
other materials are used, like GaAs or PtSi, the range is extended
further into the IR.

>The FT50 is a great transceiver

Amen! The longer I own it, the more I like it. I agree with most of
your suggestions, but remember, they all relate to the functionality
of the keyboard and the 'brains' of the radio. The RX, TX, and audio
aspects are all superb.

>Safer Battery Charger
>The manual doesn't tell you, but the diagram shows that the charger is a
>simple constant current charger.

I have a related questiion. I bought the external power cord and plug
(not the cig lighter jack, just the plug and wire) and installed a
direct 12 V DC connection in my vehicle, with a fuse in the circuit.
The first time I hooked up the radio, the wires got awfully warm, but
the fuse didn't blow. It looked like a lot of current was flowing.

Is there anything in the circuitry to limit the current going into the
battery in this situation? Should I install a resistor to do this?
Should I worry about leaving the radio on a 12V supply
on long car trips?

I have also noticed that I can't emergency-power the radio
receiver with a 9V battery, the way I could with my old Icom.
I'm accustomed to carrying a regular 9V Duracell battery, with
an adaptor, so I have a 'last gasp' in case the nicad dies. So long
as the Icom was turned on, the external power flowed to the receiver
but not to the nicad. Is there any way to make the FT-50R
work the same way?

I have an ft-11r, but the following features would be GREAT!

1. Auto-PL
When I tune to a repeator and monitor, if I want to find the pl, I have to wait until someone talks, put it in tone squelch, go to the tone selection and spin the knob, hoping the station talks long enough for me to find the PL. The radio should have an automatic feature that would search all the PL's when I activate it, set the pl to that and maybe turn on PL tx and squelch once a tone is found.

2. 2 tone DTSS
For fire and ambulance paging systems, many use 2 dtmf tones to activate. If I wanted to monitor currently I would not be able to use DTSS code because 3 tones are needed to unlock. The number of tones to be used should be settable from 1 to 4 for each channel.

3. A true lock mode
The ft-11r lock switch is great, but pressing PTT or rotating the knob stops it from scanning, no matter what. Along this line, when the knob is set to control volume and the radio is not locked, it should not stop scanning when adjusting the volume, but when it is set to channel, it should.

4. Indicator light.
MAking the tx/busy light on top and front or on the corner would make operation from a belt easier. Instead of just having the little icon flash for 5 seconds on the screen after a page or dtss, the indicator light could flash (yellow?) until reset - making the thing more functional for paging.

5. Power in
WOuld a simple coaxial dc connecter be too much to ask?

6. Speaker
The speaker is major weak. I know that's why it's small, but something that you won't risk blowing at a decent volume.

that's my 2-cents. Of course, I already have my radio, and won't be getting a new one soon. Unless a new radio came out with ALL Of this and was cheap :)

> >this?

I just did a bit of research on this yesterday. It's called FRS, Family
radio service, and here's the deal:

Tandy submitted proposal to FCC for this service.
*14 channel UHF "CB" - 7 of which are the 7 GMRS Interstitial channels
(GMRSers not happy)
*possibly emergency channel as well.
*GMRS --> FRS communication legal on common freq's.
* Watts max power
*No external antennas - no changes, adapters or anyrthng to the units.
*The goal of the FRS is to have HT like units. To be 'legal' and use
the FRS bands, your radio must be FCC tpye accepted and they do not plan
on accepting radios with external antennas, etc.
*No data
*PL is allowed.
*Radio use for small business allowed. (they couldn't be useful enough
to warrant against it)
*Not sure about DTMF, but I would assume not because the radios are
supposerd to be simple.

don't quote me on any of this because some of it could be mixed in with
the GMRS faw's I read. It seems kind of interesting. The kind of thing
a non-licensed friend might buy and you would use a modified 70 cm ht
for.

hope this helps.

Glen,

I use Drake gear for SWL and Ham and have nothing but praises for them. I have/had Drake R4C, SW4A, TR7, R7A, R8 and am getting a SW8 for my wife (and vacations). Drake has a web page www.rldrake.com that has their current line of receivers. I stack the R8/R8A receivers up against anything on the market under $1700 including the NRD525/535 and AOR receivers.

The R8 has 5 selectivity filters standard (6.0, 4.0, 2.3, 1.8, .5), duel VFO, internal antenna switching, passband, notch, synchro AM tuning, memories and scanning. The only complaints I have heard are that some folks don't like the way the buttons feel. (hope they are less critical of the XYL) :-) :-) . I currently have Drake, JRC and Sony and cannot tell the difference in button feel.

If you have more questions on performance, drop me a note.

Mark Bryant

KAWIN NEWS - Announcing BeaconClock and KaWin 6.48

It's a double-header! The initial release of BeaconClock,
and KaWin 6.48, and both are ready for download from the
KaWin Home Page:

http://www.mutadv.com/kawin

BeaconClock is Freeware for DXers who share an interest in
monitoring the NCDXF/IARU beacons!

KaWin 6.48 enhancements include:

Receive Window pop-up menu now includes a "Freeze Receive
Window" option. When checked, this inhibits automatic
scrolling to the end of the window after each pop-up menu
operation.

Context Selection Tab pop-up menu now includes a
PurgeContext menu item.

Option/Identifiers now highlights (yellow) all parameters
whose current value differs from the new suggested value.

Option/Identifiers now sets the WTEXT parameter for Kams.

Plus, many more enhancements and fixes - all described in
the Squawk64.wri file.

The KaWin News mailing list has been purged of all problem
email addresses. If your address was inadvertently removed
please accept my apologies and re-subscribe. Please pay
close attention to the email address you provide and/or the
"reply to" address set in your email client.

To subscribe to the KaWin News mailing list, send email to
stan@mutadv.com with the word SUBSCRIBE in the subject line,
or use the handy subscription link on the KaWin Home Page.
To be removed from the list, send email to stan@mutadv.com
with the word UNSUBSCRIBE in the subject line and be sure to
include the email address this message was sent to in the
body - I cannot remove you if I don't know your address!

73, Igottago... Stan ..

AOR 3000A general coverage receiver. Tunes 100khz through 2036 mhz (cellular blocked). Features include: selectable modes (AM, LSB,USB,CW,NFM,WFM), 13 band pass filters, true VFO with selectable tuning steps of 50hz through 999.95khz, 400 channel scanning capability, digital clock and s-meter.

Unit comes with its original box, manual, power supply, whip antenna and dc cord.

I am a non-smoker and the unit is in great shape. Asking $775.00 (list for over $1000!) and I will ship it to your door anywhere in the continuous U.S.

Thanks for reading this.

3323. Trade Kenwood for Ten Tec

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-07 00:00:00 UTC
From: Bob Marsh <bmarsh@hicom.net>
Message-ID: <32FB3E41.998@hicom.net>
Source record: 183842

Hi everyone,

I have a Kenwood TS-850S/AT with a YK88C-1 500 Hz CW filter. I bought this rig new in August of 1995. It has all the original packaging, docs, etc. This is my "main" rig, and it's used mainly for CW (and SSB on MARS). It has also been "MARS Modified for General Coverage TX.

I'd like to trade it for a Ten Tec Paragon 585 or 586 (preferably with a CW filter). I have two other Ten Tec Rigs, and really like them. There's absolutely nothing wrong with the Kenwood, I just would prefer to have a Ten Tec!

I'd like to do a trade of some kind, but will also consider selling the Kenwood and buying the Ten Tec somewhere else. I'll consider any reasonable offer. Please reply via private Email.

tnx es 73 de Bob/KB2SGM

3324. For Sale: US Robotics 28.8 Winmodem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-07 00:00:00 UTC
From: Bob Marsh <bmarsh@hicom.net>
Message-ID: <32FB401F.15E0@hicom.net>
Source record: 183843

Hi there,

I have a 6 month old US Robotics 28.8/33.6 Sportster Winmodem for sale. I had to replace it with a regular US Robotics Sportser when I added Linux as a second operating system on my computer.

The Winmodem is designed to work ONLY in the Windows/Win95 environment. It likes a 486DX or better processor. I've had no trouble with this modem at all, but it won't work outside of Windows. It comes in the original packaging with all docs, drivers, etc. It can be upgraded to a 33.6 by downloading the new drivers from the USR FTP site.

These are selling around here new for around $100.00 on sale. I'm asking $75.00 including shipping. Please reply viv private Email.

Thanks,

Bob/KB2SGM

But ask your local repeater owner(s) for any possible work-arounds.
Maybe your "in-laws'" Membership in a Club would allow use of the club's
License, for example.

Strictly speaking this is not Amateur Equipment. Also, you don't say
if you want something cheap or good (conflicting requirements!)

Have a look at the Yupiteru MVT-7100. The prices should be dropping now
that the MVT-9000 is out. The AOR AR8000 is also one of the best.

3336. FS: 37' Telescoping Mast - $35

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-07 00:00:00 UTC
From: gvs@netcom.com
Message-ID: <32fc76ff.352505024@192.0.2.3>
Source record: 183855
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.misc

Telescoping Mast for sale
in San Jose, CA.

37 foot Telescoping Mast, material is schedule 80 PVC Tubing,
in 4 sections, with O.D's: 3.50", 2.75", 2.25", and 1.75". The
sections are held in place by a u-clamp and thru center eye-bolt
arrangement. Each u-clamp has 2 outer eye-bolts, along with the thru
center eye-bolt, which are used as guy points.

The bottom 3 sections use PVC sched 80 reduction union joints (very
beefy) which I reamed out to allow upper sections to slide thru
freely. The three over-lapping sections are over lapped by 12, 16,
and 18 inches, from smallest to largest dia., respectively. Each
upper section has 2 sets of 3 spacer bearings that take up the
excess play inside each over-lapping section.

As you may well have gathered, I have an Engineering background
and took some time designing this Telescoping Mast. It wasn't
something I just threw together.

The last 2 years in San Jose, CA, has brought storms with winds as
high as 75 mph. This Mast barely moved during these storms. Also, I
use three sets of guys which are marine-type nylon rope that is UV
resistant.

Mast is more durable and can withstand higher wind speeds than
a steel mast, when guyed properly. Also, Mast doesn't interact
with antenna like a steel mast would.

DTMF alerting is alive and well. About 50% of the public safety agencies in my county use DTMF (touch tones) to activate their station bells, the other half use two-tone sequential (Quick Call). DTMF is faster and generally easier to deal with, but there are no manufacturers (that I know of) of monitor pagers that do DTMF decoding.

Here is a question ....I believe the only difference in the htx-212
and the newer version is in the programing of the E-prom and that it
should be an easy mod to up grade the old 212's to newer model
specs..and add out of band scan out of vfo mode....but it would be a
programming mod..

Am I far off ?? Am I close .....come on all you Radio Shack Hams
We have questions for past few years ...wheres your ANSWERS ??

The bad part is RAD SHACK could prob ugrade all our radios in less
than 10 min each at their service centers which most of us would pay a
modest fee to have it done...but they would rather have us buy the
newer model......RADIO SHACK WAKE UP.. We are not buying !!
Hell I've been waiting for 2 years for a spare 12vdc power cord for
my htx-212 ... but would have rather had one with the
same connector as my radio came with... .

YOUR MANAGEMENT IN finiancial news releases have stated YOU HAVE
QUESTIONS..why your stores are failing.....WE HAVE ANSWERS !!!
YOUR NOT LISTENING TO YOUR CUSTOMERS !!!!!

Message-ID: <5dg11p$49l@sf18.dseg.ti.com>
Source record: 183862
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

For Sale:

KLM KT-34A triband yagi beam for 10m/15m/20m
Four elements
7 dB gain over dipole
Boom length 16 feet
Longest element 24 feet
Turning radius 16 feet
Wind load 6 square feet
Weight 45 lbs
Very broad-banded

This antenna was donated to the Denton County Amateur Radio Association. It has never been removed from the box (although the box has been opened to gain access to the instruction manuals). Unfortunately, DCARA can't use it, and our storage space is overflowing, so it must be sold off.

AES currently sells this antenna at $539.95 (retail). DCARA is asking $300.00 for it, plus shipping charges. That's just a little over half price for a brand new, current model antenna! That's a bargain!!

You may contact me if you are interested. Thanks for the read!

The 62S-1 is Collins' 6 and 2 meter transverter for the S-Line. The radio is in pristine condition (collectors quality) and comes with spare 4CX250 final and original manual. Winged emblem. Price is $1,500 which includes shipping and insurance in continental US. Please reply via e-mail or call (415) 681-5659 if interested. Thanks and 73. Pat (W7YCN)

3347. Hello From Ten-Tec

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-07 00:00:00 UTC
From: tentec@usit.net
Message-ID: <5dg4i3$342$1@news.usit.net>
Source record: 183866

Greetings from Ten-Tec!

We've received several phone calls over the last couple of days regarding Ten-Tec, our web page, the Titan amplifier, disconnected telephones and the rumor mill that never stops cranking in the amateur radio community. While I do not read any USENET news groups, feel free to send us e-mail directly at <sales@tentec.com>

#1) The Titan amplifier. In recent months, we have been advertising in our ham magazine ads: "ATTENTION TITAN FANS: A final opportunity to own one of the finest amps ever made. Call for more info." Some of the ham community have interpreted this to mean we are exiting the amateur radio business, and have been faithfully passing the word on the Internet and on the ham bands. Nothing could be further from the truth! The TITAN was discontinued in early 1995 after ten years in our product line. Sales simply had dropped off to the point where it was no longer viable to continue this product. It was (and is) readily available as used gear. However, after receiving many phone calls from interested hams, we decided last summer to put together a program where we would do one final production run of the TITAN amplifier at the beginning of 1997. We started taking orders in June, 1996 and have now filled all available slots. We are continuing to keep awaiting list past these orders if anyone is interested, in case some of our orders decided to drop out.

#2) Our web page. The page <http://www.tentec.com> has been experiencing some difficulty over the past few days. We have not gotten to the root of the problem yet but hope to have it fixed and re-operational by Monday. Please be patient.

#3) Disconnected telephones. At the beginning of 1996, the powers that be changed the area code in East Tennessee to (423). If you call

our service department, fax machine, or main offices using the (615) area code, you WILL get a disconnected message. Compounding this problem is 25 years of literature, manuals, and advertising with a defunct area code listed. All of our phone numbers are the same. We have word now that the area code out here may change yet again in the next two to three years and we'll have to do it all over again.

#4) Ten-Tec, in general. While we are a diverse company, amateur radio and related products continue to account for half of our gross revenue. We have no intention of leaving the amateur radio business. We have new products come out recently, and we have new products that will be offered throughout 1997 and beyond. We are commited to ham

radio like no other company and you can continue to count on us for the quality and service you have come to expect from us since 1968.

Please feel free to e-mail me at my work address.
Until next time, thanks and 73

Scott Robbins, W4PA
Ten-Tec, Inc.

>Looking for at least one NMO roof mount for a Larsen antenna. Preferably
>without coax attached.
>KF4APJ@amsat.org

Larson NMO mounts are a clone of the standard Motorola mount. If you
can, go to a 2-way radio shop and ask if they have any junk/removed mobile
antenna assemblies you can have. It is easy to remove old coax and resolder
new coax onto the Motorola type mounts.

Joe:

Going prices, IMHO:

FT-480R $225-$325 depending on physical condition, and whether or not you have the Yaesu PL board installed. Without the board, with some scratches, figure $250. Add at least $100 for the base.

FT-290R $200-$300 depending on condition, whether or not you have the PL board, whether it's the encoder or the encoder/decoder, and whether or not you have the optional YM-50 TT mic. If you have the matching linear, the PL board, the mic, the soft case, the charger, the mounting bracket, and a mint rig, you could get as much as $450. Add at least $50-$75 more if you have the FP-2 power supply/speaker to match the rig and linear.

Joe, let me know what you have on the FT-290R, and an accurate description of the physical condition. I might be interested myself.

73,
Martin
AL7OQ/2
mfeldmn@ibm.net

P.S.: Ted, if you're reading this, the FT-480R put out 10 watts, is very early '80s vintage, and fits your description of "feature starved". The FT-290R could be almost as old as the FT-480R, but stayed on the market for a good long time, so it could also be much newer. It puts out 2.5 watts, has the battery case internal to the radio, and has features similar to it's updated, current cousin, the FT-290RII.

>
> I belive only the NEWER ones have the mars/caps capability.. and it
> isn't like other radios that give you up to 174MHz, it only gives an
> extra MHz or two... That's about all I know.

From the manual pp.17-18 of the HTX-212:

You can extend the memory and transmit frequency range from it's
standard 144.6 - 148.0 to 143.0 - 149.0 by holding down the F and DTMF
buttons while turning on the unit. Either way, the VFOs will tune
136-174.

Hope this helps!

BTW, being a new ham myself, I just couldn't pass up this rat-shack
discontinued model. A bunch of features like PLs and DTMF in and out
are standard. Very few of them left out there, but when you DO find
them, they are at $200 bucks! And if you take one that may be a display
unit, they will double the one year warranty to two years at no charge!
Now, how could I beat that? :)

How much are you willing to spend? The scanners at RS are generally not very good. The most exciting, but not overly-expensive, upcoming handheld scanner is the Uniden Bearcat BC-235XLT TrunkTracker, due in about 30 days.

It'll come with 2 800mAh nicad packs and an external charger so you can charge the pack in the scanner AND the external one at the same time. It's a 300 channel unit and has a bunch of public service services' freqs (thousands of freqs) built into the ROM (ie Service Scan). You can lock out Search freqs, plus it has Data Skip during Scan and Search. (This radio has 50% more channels than the RS Pro51, and twice as many Search lockouts as the Bearcat BC-230XLT.)

Price is approx $260 at its lowest.

Jeff

Anyone have any experience/info on using a Icom 735
with a transverter? The 735 manual is skimpy on info
on the transverter jack on the rear panel. any hints
or kinks are appreciated....

I would like to homebrew a transverter(s) for 144 and 220.

Kenwood TS-870S, SO2 TCXO, DRU3 recorder, SP-31 speaker. Latest control board EPROMs installed. Looks mint, works better than mint. Don't need it anymore after stumbling onto a FT-1000D at a good price. The 870 is good, but I think the 1000D works better for me (I need dual receivers). Price is $1850 firm. Compare to new price of rig with options. Price includes shipping charges (but not COD charges if you want COD delivery) anywhere in continental US. Guaranteed all is as stated. Famous last words...trust me! Thanks.

> *GMRS --> FRS communication legal on common freq's.

But somewhat inconvenient, since FRS uses half the deviation of GMRS. The GMRS user would have to turn his volume up, and the FRS user would have to turn it down -- and might get distorted audio if the IF has been narrowed for best performance at that deviation.

> *Radio use for small business allowed. (they couldn't be useful enough
> to warrant against it)

There are a lot of business uses for FRS, such as store security personnel talking from the sales floor to the back office. Basically, FRS is good for a lot of things that 49 MHz Part 15 radios can't do but aren't far-flung enough to justify the higher cost (and recurring license cost) of licensed land mobile services such as GMRS.

Ever think that there's a reason some repeater operators don't want their
tones published? Say, because they don't want non-members on the repeater?
That is, after all, their right, according to the FCC.

Now if I had an actual emergency, I certainly would try a closed machine
for help if I couldn't get an answer on an open repeater. But otherwise,
these fellows should be left alone.

Dear OM's

First, thanks for you time reading this post.

It might be a wrong group to post this message. But
please forward this to the groups that you think its
relevant. I think that we ham should be aware of
what's happening in our community.

The proposal includes the following debates:

(1) elimination of the Novice license
(2) creation of a new Intermediate license to replace
the Technician Plus
(3) greater hf privileges for intermediate licensees
than for the existing technician plus, including
phone on 160, 75 and 15 meters
(4) a 10-wpm General CW test (with more stringent
testing standards for all CW exams)
(5) expanded phone privileges for General-class and
higher licensees

If you have a web-browser, please visit the following
site regarding to the new proposal:

http://www.hamradio-online.com/1997/feb/arrl0131.html

The entire document is pretty long to be posted in
the news group. If many of you request the document
should be posted, let me know so I can post it to the
correct group.

I have a Tektronix 106 Square Wave Generator that is in the wrong
case. The case consists of a sleeve that the generator slides into.
If you have one of these cases, why not turn it into a bit of cash and
help me get my unit into a proper home.

If I can find a correct case, then the case that I have will be FS,
cheap. It is marked "use with TYPE 191 only."

Or maybe this means that I need to start looking for a Tek 191 in a
106 case, or no case.

If you can help out, let me know.

Hello All,

I'm looking for a HAM radio VHF/UHF transceiver also capable of
scanning and receiving TWO frequencies AT THE SAME TIME. I would like
to use this feature to monitor both the repeater input AND output
frequency AT THE SAME TIME.
Also, is it possible to pre-program the 1st receiver to search and the
2nd one to track it at a fixed frequency spacing (such as 600KHz)?
This is useful to find HAM repeater frequencies.
I've heard about the Kenwood TH-79A, but I'm not sure it can do what I
need. Any pointers would be really appreceated.
Thank's!

When responding, please email directly in addition to posting
here, since our news server isn't very up to date. Please note
that you must edit the reply email address (remove the .NOSPAM
postfix). This has been done in an attempt to reduce the amount
of junk mail received here from automatic mailers. Thank you.

regards,
techno

3392. BeaconClock, FREEWARE for DXers

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-07 00:00:00 UTC
From: Stan Huntting <stan@mutadv.com>
Message-ID: <01bc149e$0bf93140$1ee983cc@stan.csn.net>
Source record: 183966
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.misc

The NCDXF/IARU Beacons

One of the most enduring laws of DX states that there are at least two possible explanations for an apparently dead band: 1)propagation is poor, or 2)no one is transmitting. The NCDXF/IARU International Beacon Network addresses the second of these possibilities by insuring that reliable signals are always on the air, around the clock, from fixed locations worldwide. Each beacon uses identical equipment, including identical, omni-directional antennas. These beacons, sharing fixed frequencies at coordinated time slots, offer a powerful tool for evaluating propagation on the DX bands.

When complete, the network will consist of eighteen CW beacons in a time division multiplexed network, sharing a single frequency on each of the five amateur bands: 20m through 10m. The frequencies are shown in the Beacon Clock Frequency display. Each beacon transmits in a predefined ten-second window, repeating every three minutes. The schedule for each band is offset ten seconds from the next lower frequency band. Each ten-second transmission begins with the beacon's callsign followed by four, one-second dashes at 100, 10, 1 and 0.1 watts - four diminishing signals at precisely 10 dB power intervals.

Some of the eighteen beacons are not on-the-air on all five frequencies, others are not yet on-the-air at all. Beacons/bands that are reported by the NCDXF not to be transmitting are displayed in gray typeface. For more detail and current information on the status of the NCDXF/IARU International Beacon Network, visit the NCDXF/IARU web page, at

http://www.ncdxf.org/beacon.htm

OK, so the NCDXF/IARU have established a bunch of beacons out there - somewhere - each transmitting for ten seconds every three minutes on five different frequencies, that we can use to find band openings. But, how do we keep track of who is transmitting when and where to point the beam to listen for the next beacon? That's where BeaconClock comes in - BeaconClock answers the age-old question: "Who's on first?".

BeaconClock displays a real-time list of the next five beacons scheduled to transmit on the selected band and updates this list every ten seconds as the transmitting station changes. Information displayed for each station includes the callsign, short-path and long path beam headings and short path distance in Kilometers. Information for the currently transmitting beacon is highlighted at the top of the list. Armed with this information, a quantitative survey of possible DX paths on each of the five bands takes

just a few minutes.

But enough of this - you can discover the rest on your own. BeaconClock is FREEWARE program for DXers with Windows95 and you can download it directly from KaWin Home Page, at

http://www.mutadv.com/kawin

I am looking for a very poor radio FM transmitter.
It should (has to) send inside a building (500m2), or less.

I live in Vienna, Austria, Europe.
If you know addresses where to order please reply to
------- wgantner@t0.or.at -------------------------.

thank you in advance

> determine its value?
> Thanks in advance
> BOB KB8PXI Bob, It's true you can recompensate the element after changing
the crystal but I've only found it really necessayr once out of about
20 I've done. This was in a mobile and the TX freq would be about 4khz
off when it was very cold out. I thing Motorola uses a colored dot on
the crystal to identify which of the three temp curves it tested out as.
You might check with International Crystal on this.
Good luck
Chris N9LLO

3405. SOFT990 CAT for FT990/890/840

Because I'm looking for such a beast myself, I've done a bit of market
research on my own (tried to post here but no-one answered).

Basically the tranceivers that do this are the Kenwood TH-79, the
Icom IC-W32, the Yaesu FT-51R and the Alinco DJ-G5.

The Yaesu FT-50R has some limited such capability in (I think) being able
to have a primary and secondary frequency and to switch to the secondary
if there's any activity.

The TH-79 and IC-W32 have independent volume and tuning dials for the
two bands. The others only have one dial.

Over in the UK, the FT-51R is the most expensive of the lot, followed
by the TH-79. The IC-W32 is not much cheaper either. The DJ-G5 is a star,
because it's packed with features and is the cheapest of the lot.

>Also, is it possible to pre-program the 1st receiver to search and the
>2nd one to track it at a fixed frequency spacing (such as 600KHz)?

I don't think this is possible in any of the above.

>When responding, please email directly in addition to posting
>here, since our news server isn't very up to date. Please note
>that you must edit the reply email address (remove the .NOSPAM
>postfix). This has been done in an attempt to reduce the amount
>of junk mail received here from automatic mailers. Thank you.

I have spent some time writing this followup, if you want to see it,
spend the time to read the newsgroup.

Many dual band mobile rigs do this as well. They may have higher price, but keys are larger and easy to push, and displays are larger. I have a Kenwood TM732 and TM733 and each will do the above very easily, but scan rates are slow. The 733 also has an auto simplex feature that checks the input to repeater every few seconds to determine if your conversation can be moved to simplex freq. Both the 732 & 733 have a MUTE feature that will decrease receive audio in the secondary band so that audio in the primary band is easily copied. Very handy feature for times when lurking on one rptr and waiting for call on another. Dual band rigs will run about $400 to $600. Happy spending!

P.S. The 733 will scan CTCSS freqs on given rx freq. Very handy while going cross-country. Not everyone wants their CTCSS freq published in the repeater directory.

In article <5d2d9g$rd4@safety.ics.uci.edu>,
turner@safety.ics.uci.edu (Clark Savage Turner) wrote:
>
> > Dont forget about the 570's cluncky antenna tuner and last but not
> >least double conversion recieve!!!! OH NO!!!
>
OH NO what?!

I've owned both a TS-850SAT and a TS-570D. The 570D's tuner may
sound different, but it works better, more quickly, and matches
more stuff than the one in the 850! And may I add, the 570s's a
heck of a lot more sensitive! Don't believe it? Check the specs!
(And I don't just mean Kenwood's! Check out the review in the
January 1997 QST!)

Triple conversion does not necessarily make a receiver better!
It *can* make it *worse* if all it does is increase the noise
floor! My 570 will dig out signals the 850 can't, and I'm not
taking the DSP into account. If you then use the DSP ...

NO COMPARISON.

If you want to get into what really matters when you're
spending hour upon hour at your operating desk -- the user-
friendliness of these radios -- let's talk about the 850's
display that you can't read in sunlight or even from more
than three feet away in average light. Or how about the filter
selection? TWO switches? The 570's got them all on one knob.
Computer interfacing? The 570's got an RS-232 port on its
rear panel. Wanna plug BOTH a straight key AND a paddle
into your rig? Want two antenna ports? You'll have to buy
a 570. Want slope tuning AND IF shift? 570 again! How about
a meter that shows you three transmit scales, all at the
same time? Hmmm. 570. An RIT you can vary more than a meager
1.2 kHz either side of a signal, that you can clear with the
touch of a button? 570. Auto-notch? 570. And FINALLY -- a
gosh-darned tuning knob with a spinner hole again!

Like I said, I've owned both. But I only own one now. (I
think you can guess which one.) Kenwood has made a lot of
advances both technologically and ergonomically in the 8
years since the 850 came out. Sure, you can say the 570
is supposed to replace the 450, not the 850, but hey --
why then is the 850 going out the door with the 450? I'll
be surprised if Kenwood brings out a rig between the 570
and the 870. Not enough room in the price difference. Me?

I'm waiting for a TS-70S or TS-170S!

73,

Meade

Ben

You may have found an answer already but here is some food for
thought. I drive a 97 Taurs sedan also a company car so I cant go
punching holes every where. I bought the Diamond delux trunk lip
mount cant remember the model but it cost me about 65 bucks. It is
quite wide so you get a good gripping area on the trunk lip and it is
adjustable for two AXIS so it is suitable for mounting on the edge of
the tail gate on the station wagon. NO HOLES into the body. For
antennas I use the HAMSTCKS they are cheap, $20.00 per band, they have
a standard 3/8 X 24 stud mount, which couples directly to the Diamond
mount I just described and they are light and easy to remove. They
are easy to tune, the whip portion slides in and out of the tube
portion with a set screw to hold it in place. The best thing is the
work great I get excellent signal reports on the bands I work. I
suggest that you take the time to make sure the tail gate is
electrically bonded to the body of the car. Use low impedance copper
foil strip or that 1" wide flexable grounding strap that looks like
coax shield braid that has been flatened. Bond at the hinge points of
the tailgate also bond to the base of the antenna mount, I slide a
piece of tinned ground strap behind the mount and the drilled a small
hole to the under side of the trunk deck and secured it with a sheet
metal screw just a few inches from the mount. I did this because it
is hard to get through all the paint close to the edge where the
fastenning screws(set screws) of the mount are located, plus I know
it is well grounded.
The only disatnvantage is the ham sticks are about 7 feet long so i
need to remove it when I park in the garage, it is not too difficult
to deal with.

For VHF, UHF I use anothe dual band antenna with a seperate mount.

Joe

: programability would also be desirable for him. Any suggestions?

My HT experience is pretty much limited to Kenwood models, so I don't know what others provide, but Kenwood's HTs would probably be a relatively good choice. Even though the simplest way of selecting memory channels is by turning a rotary encoder knob, the radio beeps each time you arrive at memory zero, so tuning to memory 6 is simply a matter of making sure you are in Memory mode by pressing the MR key, then turning the knob until you hear the beep and then turning it 5 more clicks and there you are! And you can also select memory channels by entering the two digit number on the keypad too.

For dual band HTs, the Kenwood TH79 is not only one of the best available units, but it has a relatively distinctive set of beep tones that it emits as you use the keypad. You can tell for example when you are entering a frequency when you are entering the MHX portion, the KHZ portion, and when you have entered the last required digit.

Even when you switch bands, you get a high pitched beep when you toggle to 70cm, and a low pitch when you go to 2m.

Hope this helps!

G.

Hmm.. what if he accessed the first memory by hitting 1 [MR] and then
counting up, etc.? You do know that you can select channels by typing
[#] [MR] right? Most radios are like this now.. you can type in the
#, or use the dial. If this doesn't suit him, and he can live w/ a
single band radio, I've heard of blind people using Motorolas with
rotary dials on top that click into position. Unlike amateur radios
in which the memory "wraps around", he can turn it all the way
counter-clockwise until it stops, and then count up in channels w/
each click. Good luck, hopefully this was of some help.

I cleaned out some old boxes from a far corner of the basement oday, and I found the following old radio manuals. These are the operating/technical manuals that came with the gear (most of them contain schematics, tuning instructions, etc.). I don't want to make any money from them, but I do want to recover postage costs. I will supply any single manual for 5$.

"RCA MI-17400 Mobile Stations" for type CMCT-30A2T (trunk mount) and type CMCT-30A2F (dash mount)

"Motoroa PT Series Handy-Talkie" for PT200 & PT300 series

"Heathkit Assembly Manual SSB Transceiver SB-101"

"Maintenance of GE Accent 450 2 way radio"

"Technical Training Manual for VHF mobile radio type DT75"

"GE MASTR Progress Line personal series maintenance manual" for ET-90-A and ER-56-A

"Installation, operation & maintenance manual" for GE Progesss line models ET-90-A and ER-56-A

If no one requests them I will be tossing them out.

I believe this is true since I heard from two other Hams in the UK. who
subscribe to "Practical Wireless"(Ham Radio Magazine in England).
I have no info as to its specifications. I would assume it is an
improvment on the Dx-70TH.

I just picked up a Comet SMA501 (mini antenna) for my Standard C508A. Talk about a compact little handful...about the size of many pagers. I only use it for a receiver/scanner, so I can't comment on it's XMIT performance. It receives very well on all bands, for local Police, Fire, HAMS, etc. Fits in my shirt pocket!

I notice that the "game" generates a wide range of audio tones seperate from ctcss and beep and 1750 hz tone call. How about maybee 3 user selectable tones from 0 to 3000 hertz. and selectable dev from the front panel. I know that these are odd features but for those of us playing with voice pagers and checking discriminator levels, It would be very useful. I would assume that these parameters are set in the firmware. Anyone tried to hack the u-P. 73, Will

>Gary

The Radio/Tech Mods book I have states to PERFORM the mod:
1. disconnect the power and antenna.
2. Remove the top cover.
3. Locate the circuit board positioned vertically behind the front
panel.
4. locate and REMOVE DIODES D29 and D30.
5. locate and REMOVE DIODE D32. (cross band mod)
6. reassemble radio.
7. reset the microprocessor. (press and hold [A=B] and turn power on.)

So, I would assume you have to reinstall diodes D29 and D30, and then
reset the processor to "undo" the mod. Hope this helps.

There are imagers designed to do exactly what you want to do. I have seen them used in several factories as preventive maintenance tools. A tech goes around and examines all the switch gear, motor controllers etc looking for hot places that are not supposed to be hot. I don't know who makes them or how much they cost however.

Does anyone have a mail order source for RF components? Items like RF transistors etc.

And by the way wasn't there a rec.radio.homebrew newsgroup?

I also experienced a damaged battery after a drop. The metal
tab that hooks onto a clip on the radio bends if the battery
hits wrong (that wasn't the first drop, only the worst). I
bent it back with pliers. It wouldn't clip on at all after
the drop because the plastic and metal were too deformed.

If you'd like to try this on yours, drop it so that the radio
hits on the bottom right-hand corner (looking at the back of
the radio).

This was with a large battery, by the way, not the small one.

>Icom IC-W32, the Yaesu FT-51R and the Alinco DJ-G5.

>The Yaesu FT-50R has some limited such capability in (I think) being able
>to have a primary and secondary frequency and to switch to the secondary
>if there's any activity.

>The TH-79 and IC-W32 have independent volume and tuning dials for the
>two bands. The others only have one dial.

How about the "scan on one frequency, track at a specified freq
difference on the other" question? If the unit had two independent
scanners running in parallel at the same speed that would meet my
needs. I could set each up to start search at a different frequency
and if the scan rate was identical then they would track at a fixed
distance (of course, locking on a signal on one should also stop the
other for this scheme to work).

>Over in the UK, the FT-51R is the most expensive of the lot, followed
>by the TH-79. The IC-W32 is not much cheaper either. The DJ-G5 is a star,
>because it's packed with features and is the cheapest of the lot.

I hope the DJ-G5 appears on Alinco's web page. I'll take a look.

>>Also, is it possible to pre-program the 1st receiver to search and the
>>2nd one to track it at a fixed frequency spacing (such as 600KHz)?

>I don't think this is possible in any of the above.

If some have separate tuning dials, why can't they have seperate
scanning circuits?

>>When responding, please email directly in addition to posting
>>here, since our news server isn't very up to date. Please note

>I have spent some time writing this followup, if you want to see it,
>spend the time to read the newsgroup.

Dear Vartan: take it easy...(No need to get upset...:-)
(I always say: tame your flame...:-)
Many times there are problems on our news group server, or I'm too busy to monitor all the newsgroups I've posted in. An email simply serves as an "alarm" to check the newsgroups as well as a safety measure should my news server not be up to date. For me, sending an email in addition to a post is easy: just one key press (up arrow while composing the followup posting). I always do it automatically. Maybe you should try Forte's Free Agent that I'm using?

Anyway, I'd like to thank you for your comprehensive response. I'll take a look at the products you mentioned (some already known to me). One more question: which has the fastest scanning speed?

regards,
techno

Everyone has their favorites. As for transceivers, I would
recommend these classics:

Heath SB102
Drake TR3 or TR4
Collins KWM-2
Swan 500C

Each has its pros and cons.
I think the Drake and Collins allow you to buy crystals for
almost any band, but none will have a true general coverage
receiver.

Sounds like this radio should be named Dura-Radio. The FT-50R is one
of the radio I've been looking at lately. If I decide in the FT50R's
favor. I hope I can find one that good.

3476. FT3000 problems/questions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-08 00:00:00 UTC
From: leitgeb_c@spcvxb.spc.edu
Message-ID: <1997Feb7.235504.1@spcvxb.spc.edu>
Source record: 183919

I recently purchased a Yaesu FT-3000M to replace my aging Kenwood
TR-7930, and I have a few complaints about it. First, the power cord that
came with my FT-3000 was wired backwards, so that when it was plugged into
the radio, the polarity was wrong. Secondly, other people I've spoke
with commented that my audio had some "hash" to it, sporadically.
Has anyone had any problems with their FT3000's microphone? I can make
the "hash" appear by jiggling the microphone's cable. Also, are there
any records of how reliable this radio is?
The last question I have has to do with the cooling fans. I notice
that during long qso's, on low power, the fans will come on every 5-7
minutes or so, and shut off after a minute or two. Is this normal?
Tonight, during a QSO, the fans came on after about 45 minutes, and
then cycled on/off every 7 minutes or so.
While I do like this radio, my experience with it has not been
very positive. Yaesu seemed less than helpful regarding the power cable,
and basically accused me of not knowing the proper way to connect the
radio to a DC supply. Also, the audio problem is frustrating, since
some people say the audio on my Kenwood sounds much better.

Any ideas/comments

The manual for my HTX-202 says:

ER1: Internal RAM Error
ER1 indicates the transceiver has detected an error in its
battery-backed up option memory. This is most commonly caused by a low
lithium backup battery, but can also be caused by static discharge, or
a physical shock. To clear the error reset the transceiver by turning
it off, then holding down F+D while you turn it on again. This clears
and re initializes memory.
If the transceiver frequently displays the error have the battery
replaced by an authorized Radio Shack service center.

Good Luck.

In a computer repair shop I worked in about 10 years ago we regularly used infrared film in a 35-mm camera to photograph potential and latent hot-spots on component boards (schematics were rare for the models we worked on). I cannot recall the values of the film or the filter used on the camera but I am sure any experienced photographers can find these answers.

This seems a bit low-tech in this day of video ir and such but it worked for us...

In the Btitish Ham magazine "PRACTICAL WIRELESS", a local Dealer has an ad for Alinco radios. At the bottom of the Ad it says, "COMING in JUNE 1997 Alinco DX-71". Any info on this radio would be appreciated. Alinco USA has not responded to my repeated inquiries about this radio.

Hello,

Does anybody know a good program for DTMF and than for a 486DX4 ? I've
got now a program that's to slow on my computer it's made for a
Penthuim.

The same for a MORSE program, I'm looking for a program that undecode
MORSE signals...

So if anybody know such a program, please send me a E-mail...

Thanx

Hi,

I have a Datong AD270 Active Antenna for sale, preferably in the UK.
I live in the North London area if anyone wants to come and see it, and I
would like 20 UKP plus postage/shipping for it.

Please reply by email rather than through the newsgroups.

Thanks very much,

Dick

3492. IC-751 vs. R-71 Audio Differences

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-08 00:00:00 UTC
From: n5off@aol.com
Message-ID: <19970208140001.JAA15013@ladder01.news.aol.com>
Source record: 183935

I have both of these radios.

The R-71 has good sound, but the sound on the 751 is
very harsh, and bright.

I examined the schematics, and the audio circuits are
very similar. I have no optional filters.

Is it possible to modify the 751 to make it sound better?

There was an article in QST about how to improve (I think) the 735.

Comments?

It has taken a while to gather all the information about Bob Adler, NZ2T. I will not pass judgement on what his peers in North Texas said about him. He has seen fit to attack me with profanity and insults. Further he has violated his word in saying he will not send me any more messages nor would he post further on the ham newsgroup. So I do believe what follows based on how Adler has treated me.

Adler is running for Section Manager in a vote to be tabulated February 18. There is at least one other running against him. I am told that Adler wears an unusual ï¿½costumeï¿½, as in untucked jeans trying to be a ï¿½cool Texanï¿½, that Adler likes to bulldoze people in North Texas, that Adler thinks that only he has the right answers, that he claims to have degrees in education that no one has seen, that he spent a large sum of money sending over 4000 pieces of mail to get reelected SM, that every Wednesday he gets on the 145.19 repeater and ï¿½preaches to the massesï¿½, that Adler is truly an ï¿½Iï¿½ man, he is wholly self involved, that Adler claims credit for the work of others, he demands to be liked and to be loyal, that he has a mole in the ARRL headquarters (Rick Palm?) and that he claimed he was going to shoot someone in Calif.

I have received these comments from North Texas both by Email and direct phone conversations. Adler has threatened me as well. Do I think he has the guts to do anything, no. But this could get him so mad he actually comes here and does shoot me. My family has been informed of this but I do not scare easily. If Adler was a real tough guy (like a U.S. Marine) I would be more concerned. But I think he is more like the Wizard of Oz.

IF YOU GO TO http://www.nevada.co.uk/
you will see a phone number to call in the UK. If you call or
E-Mail"free", You will get verification on the ALINCO DX-71 radio!!!!!

Basically an advertisement was put in "PRACTICAL WIRELESS", a UK Ham
Radio magazine. In the magazine there is a Dealers ad in the January
issue. Nevada Communications in the UK says at the bottom of the AD:
"COMING IN JUNE ALINCO DX-71 !!!!"
this is all the info I have.
Now a comment on all the "FLAMMING" at me saying I make up radios
in my head "ICOM 708" etc. I only post information that I receive from
reliable sources.I am usually pretty accurate. I DO NOT make up info!
Many of you have sent me POSITIVE messages as well.

It is in fact keypad programable. You need to short out a terminal on
the back where they battery connects, and then enter a keypad code,
all of which I do not know, but it is keyboard programmable. And
correct on the ADMS-1c, you need the commercial software to program
it.

3513. RE: HTX202 Er1

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-09 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9702091604118148@atdbbs.com>
Source record: 183706

>>My HTX202 reads out "Er1" on the display and is beeping at me. Has
>>anyone had a similar problem? Any fix?

HTX-202 Error Codes (taken from a Radio Shack memo)

ER1 indicates an internal RAM error. It appears when the memory backup battery is dead, when something has caused the memory contents to become corrupt, or as a result of physical or static electric shock. To clear this error, turn off the unit. Then turn it back on while holding down the "function" and "D" buttons. This clears the memory. If the error returns after you clear the memory, service is required.

ER2 indicates a PLL unlock. The radio gives this error if the PLL alignment is off or if the transmitted signal interferes with the internal PLL frequency. This error has been reported most frequently when using the supplied "rubber ducky" antenna with either a high-power battery pack or with an external DC source.

According to the memo, the fix for this is to use an external antenna when using external DC power. The memo goes on to say that if the problem persists, send the transciever to the repair center.

3515. How TO!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-09 00:00:00 UTC
From: gold@wic.net
Message-ID: <5dlnl5$148_001@term_35.wic.net>
Source record: 183708

Can anyone tell me how to post a notice of an article for sale?

I have tried twice seen the article on the list and found it gone the next day. I was just listing an Alinco 590 Dual Band HT.

I was personally told by the Yaesu Rep at Boxboro,Ma. hamfest that they
(Yaesu) were coming out with a radio that would compete with the Icom
706 but would also have 440 mhz at 10 watts olus 2 accessory filter
slots. It seems that Alinco is going to have a new radio also if you
read my postings (called the DX-71). No info on it. I can tell you this:
All these new radios will be available sometime in the spring/summer of
1997. Can't wa't myself. Cheers, Steve NS1R

Real new to the this arena.

I am looking into purchasing either an Icom IC-W32A or a Yaesu FT-50R.

I've had many good replys about the FT-50R (Thank you for those who've responded in the past), but as one gets more exposure so do the options.

Can anyone tell me which is the better unit and why?
All opinions respected and appreciated.

Thanks, Jon

I have a suggestion that I think would be easier. Forget the IR detection.

Instead, pain a liquid crystal compound onto the area you wish to examine.

Key down in daylight and photograph the area with a normal camera on
a tripod, normal exposure.
No, I haven't a clue where to get the stuff! Anyone have any ideas?

>
> Thanks,
> Ray N1QPT

From the trusty manual... p.36:

Er1: Internal RAM error

Er1 indicates the transceiver has detected an error in its
battery-backed up option memory. This is most commonly caused by a low
lithium backup battery, but can also be caused by static discharge, or a
physical shock. To clear the error, reset the transceiver by turning it
off, then holding down F + D while you turn it on again. This clears
and reinitializes memory. If the transceiver frequently displays the
error,, have the battery replaced by an authorized Radio Shack service
center.

Also... for a bunch of info on the HTX-202, check out
http://support.tandy.com/support_electronics/15563.html

Looks like the Shack is getting their on-line act together!

Hope this helps... 73's

3545. FT-50r: To Freeband, or Not to Freeband

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-09 00:00:00 UTC
From: "John P. Toscano" <tosca005@tosca005.email.umn.edu>
Message-ID: <32FDA72C.153F@tosca005.email.umn.edu>
Source record: 183754
Body handling: Binary attachment payload not displayed: Ft50pics.exe

There seems to be a lot of interest in modifying the Yaesu FT-50r dual-band handheld transceiver to enable CAP/MARS extended transmit and the "freeband" mod which opens it up even further. I haven't done either mod myself, but I've been giving it considerable thought. It's not that I'm extremely timid at opening up a piece of electronic gear to see what's inside -- I've been known to pop open a $3,000 PC before even turning it on for the first time, so why not my $350 radio? Well, I have partly disassembled it to get a good look (and take some photos at the same time), although, as I said, no mods have been made to my FT-50r.

I'm the kind of guy who kinda feels gypped if a piece of equipment has a lot more capabilities engineered into it than are actually being made available. For example, my first personal computer was a Heathkit H89. It really frosted me that all the Heathkit software was designed for the older 8080 CPU, rather than taking advantage of the additional features of the Z80 CPU found in the H89. So I took up Z80 assembly language programming and went ahead and took advantage of the greater power of the Z80. You'd think that a guy like me would jump at the opportunity to squeeze out all the extra capabilities hidden inside the FT-50r.

Potential justifications for the MARS/CAP mod, other than the obvious (i.e. someone holding the proper permits as part of the Military Affiliate Radio Service or the Civil Air Patrol):
-- This mod extends the 70cm band transmit range to include all of the 70cm Amateur band, 420-450 MHz. Without the mod, the lower 10 MHz of the band (420-430 MHz) is not available for transmission.
-- In an honest-to-goodness, life-or-death situation, the FCC allows anyone to transmit on any frequency, with or without a license, to obtain assistance. With the MARS/CAP mod activated, the FT-50r is able to transmit on frequencies used by local police, fire, and ambulance crews in my area, since they fall within the non-Ham extended frequencies of 148-159 and 450-470 MHz. However, this may or may not apply to your location.

Arguments against this mod, other than the obvious (you are stepping outside the law by performing the modification without the proper licenses/permits):
-- All of the 70cm activity in MY area falls within the range of the unmodified FT-50r, namely 430-450 MHz. Would I find anyone to talk to at 420-430 MHz?
-- Since the PTT button is used for multiple purposes on this radio, it is not all that hard to accidentally key the transmitter by accident, for example, while performing a standard menu setting

adjustment or halting the scanning process. Granted, such an accidental burst of carrier is most likely going to be VERY brief, nevertheless I doubt if the local police, fire, or ambulance crews will appreciate it!

Potential justifications for the "freeband" mod, in addition to those mentioned for the MARS/CAP mod:
-- This mod enables transmit and receive on another band that you are licensed for, namely 1.25 meters (222-225 MHz). This entire band is disabled (BOTH receive and transmit!) in the unmodified radio.

Arguments against this mod:
-- This mod is even "less legal" than the prior one, since it enables both transmission on frequencies that you are not likely to hold a license for, and it enables the reception of frequencies that are disallowed by current FCC rules (cellular phone frequencies in the 800 MHz band).
-- Because the 220 MHz band is apparently blocked in the radio due to a conflict with Japanese frequency allocations, there are other components in the radio that cause it to have very poor reception performance and very low effective radiated power (only milliwatts apparently) in this band. Without some additional mods (which I
have never come across), the 1.25 meter band capabilities are not worth much.
-- Why expose yourself to the liability of using a radio that tunes in cellular frequencies illegally? Especially when you consider that a loophole in the law and a "defect" in the radio allows you to effectively scan the cellular frequencies legally, by tuning to frequencies offset from the desired ones by twice the value of the first IF?
-- At least one person has had a "small slip" while doing the mod that did significant damage to his radio. Think it can't happen to you? Think again. I have enclosed some photos with this posting in a self-extracting archive file. They should help to clarify the exact locations of the adjustments and mods mentioned in this news group. They should also impress you with the delicacy of the technique needed to perform the mods. (Yes, I know that I would need a much finer-tipped soldering iron than the one shown in the pictures! I was trying to make a point there. And NO, it was NOT plugged in at the time!)

Hmmm... I guess I'm going to think about this some more before I jump right in there and void my warranty...

I have used both radios as well as Icom's 736 (160-6 100 watts,
internal tuner, and power supply)

Try to find a 736 on closeout, it beats both the 756 and 570 for
about $1800 !

Kantronics TNC KAM+ w/ver 8 chip & less than 20 hours service. No
software (except what comes with it, which from what I understand is'nt
much). Never developed an interest in Packet. Does all that stuff: GTOR,
PACTOR, WEATHER, HF, CW, RTTY, simultanious dual mode, etc. This unit
was purchased new 8/95 and went back into the box 1/96. Sells new on
street for about $300.
Asking $230 firm - will ship.

In addition to the others already mentioned, let me add
the discontinued Icom W2A which may be had for about $300
on the average at ham fairs, or rec.radio.swap. It sports
two separate displays for each band (VHF vs UHF).

3556. Kenwood 520s fan voltage?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-09 00:00:00 UTC
From: aa753@freenet.hamilton.on.ca
Message-ID: <5dkpu6$fd2@main.freenet.hamilton.on.ca>
Source record: 183765

I have a spare ventilation fan for a Kenwood 520S (the hybrid
transceiver that used tubes for driver and finals).
Now I'd like to use it for another purpose but I haven't a clue as to
whether it runs on 120 volts AC, 6.3 v. AC or 12 volts DC. and I'm not
technically astute enough to know if there's a non-destructive way to find
out.
Could someone who has a 520s take a look at the manual and try to
determine where the fan gets its power?
My manuals went with my 520s when I sold it last year. (Had the
transceiver for 18 years -- never did have to replace the fan!)

Gary:

Lots of people say that the '1000D is the best radio available (BTW, there is no "FT-1000DM"...only the '1000 and '1000D, in addition to the new '1000MP. which is positioned as one notch down)

They are available used. Most to the radios put in distribution were '1000Ds, so that is what you're more likely to find. A *good* one goes from $2500 to $3000 used. If you can get a regular '1000 (non-D), that could be worthwhile. The difference is that the "D" comes with a couple more filters(which you can pick up later), the high stability TCXO unit, and the bandpass unit that would allow you to have high receiver performance on two separate bands simulteuously (with two antennas). This feature is not particularly convenient if you run an amplifier, however (where one antenna lead probably runs from the amp into the rig and the switching takes place downstream) but at least it's possible. Some other dual receive radios don't have this capability.

I'm not sure what you mean by "Are they really as hot as they say that they are on the quite receive end?" Maybe you are referring to the receiver? Yes it is quiet (the quietest).

IMO, as far as top of the line radios go, the Yaesu is the best. The Kenwood 950SDX is not in the same league, especially if you value the dual receive feature. It's not implemented well on the '950. Actually, the '950 has been a poor seller and there aren't that many around.Of the three top HF rigs, it is the oldest technology. It is still a nice radio, but you'd be better off with an '870 if you were a Kenwood nut.

The Icom '781 has always been overpriced because of the "cool" display. It is not the best radio Icom ever made. It is generally agreed that this is the '761 or '751A, from a receiver standpoint (they had been greatly improving their receivers until they lost a lawsuit with Kenwood), but the '781 has the display and dual receive capability. If you go this route, you will have a hard time using aftermarket mikes, like the Heil, because the Icoms need a preamp in the mike. I've owned a zillion Icoms and like them, but this feature bugs me. The '781 is nice, too, but the '1000D will outperform it and you'll spend a few hundred dollars less. A good one of those is also harder to find.

You won't go wrong with any of them if you get them at the right price, but buying a '1000D generally means never having to say you're sorry!

Sorry for being a skeptic....
I own the original DX-70 and LOVE it!. It's a great little mobile rig.
I've used it from 75 thru 6 meters with no problems (haven't tried 160
mobile yet)
Will be interesting to see what is improved.

Source record: 183773

How is the FT-1000 MP modified to transmit in general coverage?

Turn the radio with the FAST and the LOCK key pressed at the same time.
then press the FAST and the ENT key to access the menu.
then go to menu 9-9 and set it to GEN then press ENT to get out. To get
it back to normal repeat the steps and select 15 instead of GEN.

Turn ON the radio with fast and lock keys depressed
this should enable the further menu items, note it is fast and lock
use fast and enter after this to enable normal menu mode
You should see further menu items 9-1 to 9-9 now

FS: Icom 775DSP $2,850

I ship.

No COD's, Send Certified Check or Money Order, since I hear on the news groups people have problems receiving the COD and that a bad personnel check could be used for payment.

IC-775DSP: $2,950.00 with no Filters.

The radio is one year old and in New/Mint condition no smoking and always covered.

This is installed and is included, CR-282 High Stability Crystal Unit Contains a Temperature - Compensating Oven Heater and Crystal Unit for improved Frequency Stability, + or- 0.5ppm (-30 to + 60 degrees C or -22 to + 140F)

If you want Filters pick the ones you want and add to the $2,850.00.

9Mhz Filters
$75.00 FL-101: 250 Hz / -6 dB CW Narrow)
$50.00 FL-102: 6.0 kHz / -6 dB (SSB Wide/AM Med. /FM Narrow)
$60.00 FL-223: 1.9 kHz / -6 dB (SSB Narrow)

455 kHz Filters
$150.00 FL-53A: 250 Hz / -6db (CW Narrow)
$150.00 FL-222: 1.9 kHz / -6 dB (SSB Narrow)

All Original and no modifications done by me. Icom Modified the back lighting flicker problem and the AGC problem that was reported in the QST tests.

Original Box and Manual.

Reason for selling; use very little and more radio than I need.

Radio can be seen at: http://icomamerica.com/amateur/hf/

Specs. Below from the Icom page.

Pull Out Those Weak Signals with ICOM IF-DSP!

Dimensions: 16.7 (W) x 5.9 (H) x 15.4 (D), 36.8 LB
DSP (Digital Signal Processing) TX/RX
200 W Stable Output Power (SSB/AM/FM/XCW/RTTY)
Built-in Heavy Duty Power Supply
Fully Adjustable DSP Noise Reduction

Level/Width Variable Noise Blanker
PSN Modulation
Audio Peak Filter
Dual Watch (2 Receivers)

3573. Coax Info Request

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-09 00:00:00 UTC
From: rmwatson@eskimo.com
Message-ID: <E5CIF0.7r@eskimo.com>
Source record: 183782

Good day. I have a coil of military coaxial cable, and the specifics are as noted:

Manufacturer: Plastoid Corporation

Type: M17/163-00001
Mil-C-17 77314

What I would like to find out is this:

* Characteristic Impedance:
* Velocity Factor:
Capacitance per foot:
Dielectric Constant:

*Note: These are the most important to me, so if possible, I would like this information.

Your help is truly appreciated. Thanks.

: >I am looking for any Icom IC-701 HF transceiver mods especial the extended
: >TX and RX mods.

: That radio is old enough (vintage 1978!) that it did not have General
: Coverage receive ... and thus, no mod to go anywhere the basic
: receiver didn't go.

Yes, you're right. The radio is an old 1978 vintage and does not
have general coverage receive but that does not mean it can't be modified
for extended TX or RX. This radio is 100% solid state and uses a PLL
synthesizer for frequency control.

Just as a 40 channel CB can be modified for extended TX/RX so can this radio.
Also the radio does not have general coverage receive but does receive
a wider range then the transmitter. I seen the mod for that one but
never kept it because I never owned one at that time. I think you jumper
two of the pins on the ACC plug to get extended TX but not sure which one's.

The extended frequency range is not the only mods for this radio. They
range from computer control via the ACC connector to improved filtering
but most of the mods are from old 1978 to 1984 magazines like QST and
I have little access to older material to reference this. I think
Icom had some factory modifications sent to the dealers for several
improvements like improved audio, etc.

Finally, I would like to get some technical info on this radio like a
service manual, factory notes, etc.

I am interested in becoming a ham. I was given an ICOM IC-W2A radio by a friend of mine, however he lost the manual. Is there a place on line that has a .pdf file or a text file of the manual? I would really like to know how this radio work. I will be testing for my license at the end of the week and I'd like to get on as soon as possible...

Thanks,

Ozcar Cortez
future ham.

You might try Mr. NiCd - 608-831-1082. I just picked up an FNB38 from
them for my FT-11 for $45, which is very reasonable. They handle
batteries for a LOT of equipment.

>the Kam.Thanks in advance.

I have not tried it in dual port mode but I think Hyperlog might do it. It is shareware so you can try it first. I use Kagold which will do the logging but not awards tracking. However, you can import the log file into a logging program.

Dave

PS- checkout http://www.interflex.com for more info on Kagold.

3579. Yaesu 51R mods wanted

Newsgroup: rec.radio.amateur.equipment

From: tleamy@instanet.com
Message-ID: <5dl7qk$mml@gandalf.instanet.com>
Source record: 183788

Hello and thank you for reading this message.

I am wondering if anyone else has experience with any "soft mod"
modifications for the yaesu 51R that will "tighten" up the squelch.
I live in an area where there is not very much intermod, and am not
pleased with the rejection the squelch circuit of the 51R.

Any similar experiences or solutions??

Hello Out There...

Anyone have any experience with the 23cm PSK packet-radio RTX for
1.2Mbit/s by Matjaz Vidmar, S53MV in Slovenia?

(those interested can find more info at:

http://www.hamradio.si/hamradio/packet.html

a quite nice site, BTW!)

Anyway...

Sounds interesting at least but due to my eyesite, I have trouble
reading the online schematics and layouts.

Would be interested in the opinions and experiences of those that have
looked at and/or tried this system.

Take Care & 73

3581. RE: Alinco and Icom mods

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-09 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9702081653348061@atdbbs.com>
Source record: 183838

>>Does anyone have the mods for wider coverage for the Alinco DR-605T or
>>the Icom IC-2340H? I tried the BARC archive with no luck.

This is all I currently have on the ICOM 2340H...

Subject: IC2340H att modification.
From: 4z4zq@pc.4z7aba.ampr.ORG (Pinchook Ronen)

Hi guys,

This text deals with ICOM's Mobile radio IC2340H. On some of icom dual band
mobile transceivers there is an RF attenuator which attenuates the received
signal by 20dB. In my opinion this is a great feature especially when you
operate in cities or in area's with lot of RF signals, repeater, etc.

The attenuator function reduce the intermodulations that appears while
receiving in those areas, and let you listen more quietly on your favorite
channel, when you listen to a local repeater you can hardly feel the 20dB
attenuator, but the intermodulations almost disappear.

The problem is that the attenuator was featured on old icom mobile rigs
(such as IC2340H, IC3230H), but not on the IC2340H. The next lines will
guide you how to add this feature. All you need is 2 1p2t small switch,
and 2 12Kohms resistors.

VHF MODIFICATION
1. Open the upper cover of the transceiver.
2. Locate D9 on the print (left to the Power Amplifier while looking from the
front of the transceiver)
3. Solder a 12K resistor to the anode of D9 as close as possible to the diode,
(with no wire, the pin of the resistor should be soldered to the pin
of the diode)
4. The other side of the resistor should be wired to the small switch
(the switch can be mounted on the back of the transceiver, there's an hole
in the heatsink which you can use to insert the wires to the transceiver.
5. The other side of the switch should be tied to 5V
(you can find a 5V terminal at J2 pin 2, j2 & j1 located near the VCO
at the front of the print it is a 2*4pin sip connector, j2 is closer
to the VCO.

UHF MODIFICATION
1. Open the lower cover of the transceiver.
2. Locate D17 on the board (this diode is wired under the board, just beside
L22. there are 2 holes, I am talking about the one located closer to the
antenna)
3. Solder another 12K resistor in the same way it was done in the vhf to
the anode of D17 just under the print (the anode is the left pin of

the diode ,the pin which located closer to the power amplifier.
4. The other side of the resistor should be wired to the other small switch...
5. The other side of the switch should be tied to 5V
(for example to the right pin of the regulator IC7)

Explanation
When you turn this switch on, it turns the diodes on, and attenuates the
received signal.

This modification was tested, but you will do it on your own risk.

Good Luck
Aviad, 4X6TL.

3583. Mods for the TH-79A (Delux)??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: Mitch <slwkm@cc.usu.edu>
Message-ID: <32FF9419.14F5@cc.usu.edu>
Source record: 183540

I've read the mod sheet for the TH-79A. I have the newer Delux version.
I tried the 79A "wide-band" mod on my 79A(D). I did gain RX access to
the 300 MHz band and got 2 new menu options. But my other bands were
different then the mod sheet specified.

My results According to Mod sheet
---------- ----------------------
RX: 118-174 should be 67-180
410-470 should be 400-512

TX: 136-174 should be 136-180
410-470 should be 400-512

Has anybody else tried this mod or others on a TH-79A(D)H?
The mod sheet says the American (K) model is without 800MHz band on a
79A. Is the 79A(D) in the same boat? Someone posted that the chips are
there. (?)

Any info will be appreciated.

3585. SWAP MY PRINTER FOR YOUR HICKOK TUBE TESTER

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu
Message-ID: <5dm06t$dd9@csu-b.csuohio.edu>
Source record: 183542

If you have Hickok 539C, 580, 752A, 700 Cardomatic, military model, etc. in
good condition that you wish to swap for my Panasonic KX-P1595 Multi-Mode
Office Duty printer, let's communicate. You might not realize that you could
use it, please read on!

Many folks think dot matrix is passe, but not so. The reasoning follows:

WHY BUY A WIDE CARRIAGE COMMERICAL QUALITY OFFICE PRINTER ANYWAYS???

(I use a simple printer switch box between my laser and dot martix to save $)

* CHEAPEST TYPE OF PRINTER TO OPERATE for draft printing compared to wasting
your expensive laser or inkjet cartridge on drafts. Use them for the final
copy only. Ribbons are $2.89 each in boxes of six!!! Call MEI/Micro Center
1-800-634-3478 and you'll see.

* BE ENVIRONMENTALLY CONSCIOUS. Use any paper you want for drafts. Recycle
regular or the 15 inch wide carriage computer printouts from the office,
just print on the reverse blank side. You can also feed the printer
recycled cut-sheet paper as well. Great savings on paper costs if you print
alot and hate reading stuff off your screen.

* Businesses still use them for cost savings reasons and to print multi-part
forms and for inexpensive dot-matrix mail labels. The approximately
equivalent current wide carriage model, the Panasonic KX-P3626, sells for
$420 in the Office Max Catalog and has a list price of $520.

* Dot-matrix printers can print a page from a web site on-line a lot quicker
than a laser many times. The reason is that you must wait for the laser to
process the entire page, whereas the dot matrix prints it out line by line.

I have 2 MB of ram on my NEC 95f Office Duty Laser and have found this to be
true. Of course no dot matrix will yield the print quality of a laser, but
one makes compromises, if it's only for one's own reference.

* Dot Matrix is great if you are using your modem with, for example, the
library to download cites, articles, etc. With a laser you can't print a
line at a time, you must print the whole page, but the dot matrix
economically does your cites a line at a time.

* Durability, the high quality office wide carriage units generally don't
break, they just keep on ticking!

* The wide carriage is great for printing many-column spread sheets
(businesses use them for this too)

OKAY Here's the Panasonic's Specs:

- Works with Windows 3.1 or Windows 95 - You select driver from Windows
- 15 inch wide carriage
- 9 Pin Dot Matrix
- Weight = about 35 lbs.
- Friction or tractor feed of any width paper up to 15 inches.
- Form Length: 3 inches to 12 inches via a form length dial or via your
software
- Pitches Built In: 10, 12, 15, 17 per inch and Proportional Spacing
- Fonts: Draft, Bold PS, Courier
- Controls: On Line
Form Feed
Line Feed
- Pararell Printer Port:
- Has Optional Serial Port:
- Rear Paper Bail:
- Single Sheet Feeder:

This unit is in good cond. and is worth $250. If you are not interested in
swapping, I will gladly consider reasonable offers on the unit & you pay
shipping.

If interested, please email me at:

l.mclaughlin@popmail.csuohio.edu

Thank you.

What I can guarantee you is the Keys to success.
The rest is up to you!

F r e q u e n t l y a s k e d Q u e s t i o n s &
A n s w e r s

Q. How does NeTeL make it all possible?
A. NeTeL does not invest vast sums in advertising, which
only creates higher rates for customers. Therefore they
are able to pass those savings along to the
customers.

Q. How long will it take to switch to NeTeL from another
carrier?
A. 5-7 business days after receiving your call or from the
time they receive your application.

Q. How do I get paid when I sign up people?
A. You'll receive $100 commission advance by finding 3
people like you to become Independent Representatives.
You'll also receive 5% commission on the first level
(first level $2500 or greater, otherwise 2% applies)
and an additional 2%, 8 levels deep.
That's a 19% pay-out.

Q. When will I receive a check from NeTeL?
A. After 60 days from the time you enroll someone in NeTeL.

Q. What other service does NeTeL provide?
A. NeTeL currently offers, prepaid calling cards, calling cards
with international access, travel cards, preferred option card
with features such as voice mail, fax mail, conference calling,
lotto results, headline news, sports update, stock quotes and
more(earn cash profits and a 2% residual income on this card.

Pager services, cellular services and Internet access are all on=

the way.

Q. How do I keep track of the people I sign up?
A. NeTeL does it for you. You'll receive a free report outlining=

the billing activity of subscribers in your personal network
along with your commission checks.

Q. Can I really make money with NeTeL?
A. Look what happens if you refer 3 people and they refer
3 people each.

<><><><><><><><><><><><><><><><><><><><><><><><><><><><><><>
N E T E L & T H E O P P O R T U N I T Y
<><><><><><><><><><><><><><><><><><><><><><><><><><><><><><>

Telecommunications is currently a $100 billion industry.
This industry is growing at a rate of 500 million per month
and currently is the fastest growing Industry in America.

Founded in 1985, Wiltel (part of LDDS/WORLDCOM) owns and
operates a nationwide 100% digital fiber optic network
providing both domestic and world wide services.
You may have seen the LDDS WORLDCOM commercials on Television
with Michael Jordan selling long distance.

NeTeL contracts with Wiltel and markets these products and
services through Cooperative Marketing: Giving self-starters
like you the opportunity to be in business for yourself but
not by yourself, by virtue a very solid support system.

The NeTeL business opportunity allows you to make money in
your spare time and can eventually grow into a full time
business.

* NO INVESTMENT
* NO INVENTORY TO STOCK
* NO ANNUAL RENEWAL FEE
* NO HYPE
Here is the catch......NOTHING

T a k e a l o o k a t w h a t t h e N e T e L
b u s i n e s s o p p o r t u n i t y h a s t o
o f f e r :

>> Start with $100 commission bonus.

>> 9.9 cents per/min. There are other rates to choose from
(1-800-99-NeTeL for details).

>> Up to 50% savings on International calls.

>> Home 800#. 9.9 cents/min 24 hours a day, 7 days a week.
Avoid heavy toll charges-Perfect for kids away at college.

>> Zero surcharge calling cards.

>> Pager, Internet access, calling cards, prepaid calling cards,=

preferred option cards- All with very low rates. Cellular
phones in the near future.

>> 100 % digital fiber optic network

>> One bill from your local telephone company.

>> Free Starter package.

>> REWARDS SUCH AS:
* A new TEL3 Pager with National 800 Service for 1 year.
* A relaxing Caribbean Summer Vocation for Two.
* $300 a Month Toward the Car of Your Choice.

NeTeL is committed to increasing the compensation and benefits
for all representatives as the company broadens its operations
in the ever expanding world of communications.

>> NeTeL pays you 8 levels of compensation

Quite simply NeTeL provides some of the best product and services=

on the market, not to mention the lowest rates.

Don't listen to people who tell you they can guarantee you
success - No one Can!.
What I can guarantee you is the Keys to success.
The rest is up to you!

F r e q u e n t l y a s k e d Q u e s t i o n s &
A n s w e r s

Q. How does NeTeL make it all possible?
A. NeTeL does not invest vast sums in advertising, which
only creates higher rates for customers. Therefore they
are able to pass those savings along to the
customers.

Q. How long will it take to switch to NeTeL from another
carrier?
A. 5-7 business days after receiving your call or from the
time they receive your application.

Q. How do I get paid when I sign up people?
A. You'll receive $100 commission advance by finding 3
people like you to become Independent Representatives.
You'll also receive 5% commission on the first level
(first level $2500 or greater, otherwise 2% applies)
and an additional 2%, 8 levels deep.
That's a 19% pay-out.

Q. When will I receive a check from NeTeL?
A. After 60 days from the time you enroll someone in NeTeL.

Q. What other service does NeTeL provide?
A. NeTeL currently offers, prepaid calling cards, calling cards
with international access, travel cards, preferred option card
with features such as voice mail, fax mail, conference calling,
lotto results, headline news, sports update, stock quotes and
more(earn cash profits and a 2% residual income on this card.

Pager services, cellular services and Internet access are all on=

the way.

Q. How do I keep track of the people I sign up?
A. NeTeL does it for you. You'll receive a free report outlining=

the billing activity of subscribers in your personal network
along with your commission checks.

Q. Can I really make money with NeTeL?
A. Look what happens if you refer 3 people and they refer
3 people each.

The prices vary from a low of $750 to a high of $900.
It depends on condition, "extras" like fillters

3593. Re: Help me get started!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: "Phil, K6LS" <k6ls@amsat.org>
Message-ID: <32FF7B95.7949@amsat.org>
Source record: 183596

Now Your Talking is a good starter book. I suggest that you read it first

then ask your questions/ buy a rig. This small step may save you some money

and will help you interact on a "higher" level (you will have a better

understanding of "ham radio" and the terms we use)

otoh If you have a scanner that covers the "ham" bands, you could monitor

the various repeaters and simplex freqencies, this will help you get an

idea of the things that go on and the activity levels for each band.

Good luck, 73 de Phil K6LS

3594. Collins KWM-1 with power

From: "Edward A. James" <EAJAMES@sandia.gov>
Message-ID: <32FF91EF.2EBB@sandia.gov>
Source record: 183599

I have an ICOM IC-271A
The radio has an aftermarket preamp/IF installed in it.
The board is located in the same area that the ICOM preamp would occupy.
It contains a pre-amp and it replacs the first IF.
Any information on who made this product and a schematic would be
appreciated.
The radio is not functioning and I have traced the problem to the board.

:

Have the newer Ham rigs fixed the overload problem, such as the ICOM 2410 has, when listening to two frequenies within the same band?

At that time, I called ICOM, but the fellow I spoke to didn't even know there was a problem. Then I received a letter from ICOM thanking me for bring the problem to there attention and they would be working on a solution.

And does anyone know if ICOM ever mentioned a patch for the problem in the 2410, besides turning on the ATT function?

Thanks

Michael (shotgun@best.com)

Source record: 183606
Body handling: Binary attachment payload not displayed: FT50R-01.JPG, FT50R-02.JPG, FT50R-03.JPG, FT50R-04.JPG

I'm sorry, but the original Usenet posting was my very first, and I overlooked something pretty important, namely that not ALL of you folks out there are using IBM-compatible PC's. I wrapped up the 4 photos into a self-extracting archive file that needs MS-DOS or something compatible in order to extract the pictures. Ouch! I have re-posted the message, and this time I am attaching the four scanned photographs directly as JPEG images. I hope that this works for you folks with the Macs, and those with the "real computers" out there, that is to say, Unix boxes, of course! ;-) John P. Toscano (KB0ZEV)

----------<original posting starts below>----------

There seems to be a lot of interest in modifying the Yaesu FT-50r dual-band handheld transceiver to enable CAP/MARS extended transmit and the "freeband" mod which opens it up even further. I haven't done either mod myself, but I've been giving it considerable thought. It's not that I'm extremely timid at opening up a piece of electronic gear to see what's inside -- I've been known to pop open a $3,000 PC before even turning it on for the first time, so why not my $350 radio? Well, I have partly disassembled it to get a good look (and take some photos at the same time), although, as I said, no mods have been made to my FT-50r.

I'm the kind of guy who kinda feels gypped if a piece of equipment has a lot more capabilities engineered into it than are actually being made available. For example, my first personal computer was a Heathkit H89. It really frosted me that all the Heathkit software was designed for the older 8080 CPU, rather than taking advantage of the additional features of the Z80 CPU found in the H89. So I took up Z80 assembly language programming and went ahead and took advantage of the greater power of the Z80. You'd think that a guy like me would jump at the opportunity to squeeze out all the extra capabilities hidden inside the FT-50r.

Potential justifications for the MARS/CAP mod, other than the obvious (i.e. someone holding the proper permits as part of the Military Affiliate Radio Service or the Civil Air Patrol):
-- This mod extends the 70cm band transmit range to include all of the 70cm Amateur band, 420-450 MHz. Without the mod, the lower 10 MHz of the band (420-430 MHz) is not available for transmission.
-- In an honest-to-goodness, life-or-death situation, the FCC allows anyone to transmit on any frequency, with or without a license, to obtain assistance. With the MARS/CAP mod activated, the FT-50r is able to transmit on frequencies used by local police, fire, and

ambulance crews in my area, since they fall within the non-Ham extended frequencies of 148-159 and 450-470 MHz. However, this may or may not apply to your location.

Arguments against this mod, other than the obvious (you are stepping outside the law by performing the modification without the proper licenses/permits):
-- All of the 70cm activity in MY area falls within the range of the unmodified FT-50r, namely 430-450 MHz. Would I find anyone to talk to at 420-430 MHz?
-- Since the PTT button is used for multiple purposes on this radio, it is not all that hard to accidentally key the transmitter by accident, for example, while performing a standard menu setting adjustment or halting the scanning process. Granted, such an accidental burst of carrier is most likely going to be VERY brief, nevertheless I doubt if the local police, fire, or ambulance crews will appreciate it!

Potential justifications for the "freeband" mod, in addition to those mentioned for the MARS/CAP mod:
-- This mod enables transmit and receive on another band that you are licensed for, namely 1.25 meters (222-225 MHz). This entire band is disabled (BOTH receive and transmit!) in the unmodified radio.

Arguments against this mod:
-- This mod is even "less legal" than the prior one, since it enables both transmission on frequencies that you are not likely to hold a license for, and it enables the reception of frequencies that are disallowed by current FCC rules (cellular phone frequencies in the 800 MHz band).
-- Because the 220 MHz band is apparently blocked in the radio due to a conflict with Japanese frequency allocations, there are other components in the radio that cause it to have very poor reception performance and very low effective radiated power (only milliwatts apparently) in this band. Without some additional mods (which I have never come across), the 1.25 meter band capabilities are not worth much.
-- Why expose yourself to the liability of using a radio that tunes in cellular frequencies illegally? Especially when you consider that a loophole in the law and a "defect" in the radio allows you to effectively scan the cellular frequencies legally, by tuning to frequencies offset from the desired ones by twice the value of the first IF?
-- At least one person has had a "small slip" while doing the mod that did significant damage to his radio. Think it can't happen to you? Think again. I have enclosed some photos with this posting in a self-extracting archive file. They should help to clarify the exact locations of the adjustments and mods mentioned in this news group. They should also impress you with the delicacy of the technique needed to perform the mods. (Yes, I know that I would need a much finer-tipped soldering iron than the one shown in the

pictures! I was trying to make a point there. And NO, it was NOT plugged in at the time!)

Hmmm... I guess I'm going to think about this some more before I jump right in there and void my warranty...

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy

If they are listenin to Fm radio, you can purchase a device from most any consumer electronics store that allows you to transmit CD audio (or whatever) to a nearby stereo. Most devices will allow you to tune them for the entire band. Simply attach a more resonant antenna, tune to the station they listen to, then pump the most absurd music into thier system. If they change stations, you can too.
Of course, interference of this type can get you into a heap of trouble.

For cassette players, a 25W mobile 440 rig, into a 4 ele beam pointed at the equipment in question will quiet that device fo a while. Although I do not reccommend this.

Story: I had a gal at work that cranked her headphones up SO loud, I could hear Stevey Wonder's harmonica down the hall and into the bathroom! She worked in the office just behind the wall, and behind me. She was using the cassette player on her walkman. First I brought a CB walkie talkie in, a 5W'er.. Did no good. Then one day I was trying to key up a local 440 repeater when I noticed the audio on her headphones quiet a bit on transmit. I placed the ht as close to the wall as I could, keyed it up, and it wiped the audio out completely. For some reason I could not hit the repeater that day, but sure was fun trying.

All in fun guys.
(or the info nazis will getch'a!)

From: captain@norden1.com
Message-ID: <32FFB1BB.2870@norden1.com>
Source record: 183613

Kenwood lists also a beyond Mars mod for this radio as follows:

Put the green wire back together, Locate the 2 "0 ohm" resistors
on the other side of the board that the "green" jumpers are located.
Remove the one closest to the copper spring. This is resistor r546.
Reset the radio, and the range should be as follows:

VHF 136-173.995mhz TX 118-174mhx RX
UHF 410-469.995mhx TX 300-470mhz RX

I have tried this mod, and it does work better than the normal mod.
My question is, I did not get a schematic with my unit. I always
have gotten one with every other Kenwood I have purchased in the past.
I know that Icom does not ship one with the 706, but what is Kenwood's
problem? I paid enough for the radio!!!! HA!HA!

Tnx es 73,
MIKE KA8WPC
http://norden1.com/~captain

P.S. Anyone found if this radio does 800mhz?

It's already $79.

The problem on my laptop was that all the places you need contrast
have their colors mapped to the same gray level. The data was there,
you just couldn't see it. I called support. They said they weren't
gonna fix it so you could change the color mapping.

I'd be interested in learning what you're gonna do with it. I found it
to be a neat toy, but of no practical value. Try looking at the Vsync
waveform for SVGA. The record length is too short. You can't see the
whole
vertical interval. If you slow down the sample rate, you miss the
pulse. Waveforms don't get much simpler than that. It's not
calibrated.
No pretrigger view. No delay. Lcd resolution is pitiful.
Needs external power supply. The list goes on.

Oh, there's also the interesting issue of what happens when
you accidentally probe the wrong place and fry your $2,000 laptop.

But it is a NEAT TOY.
But I took it back anyway.
I look forward to the next few generations.

Glenn Schultz wrote:
>
> I have an opportunity to buy an Icom IC-720A at what looks to be a very
> good price.
> Are there any opinions, complaints, etc about this rig?

Glenn:

This is one radio I would avoid like the plague. It's not a performance issue, the rig is solid in that respect. The rig is known for a clunking noise when you switch bands, due to a large solenoid that is used. When that solenoid fails, it is no longer available from any source. Due to the age of the rigs, they are now failing at a fairly substantial rate.

There was a mod to replace the offending part with a smaller British solenoid which appeared some time back in one of the British mags, but it involved some fairly major surgery on the rig. I can probably wade through my collection and find the specifics if you really need them.

Hope this was helpful.

The range of $750-900 sounds more like a TS-440/SAT, than a TS-450/SAT.
The TS-450/SAT rigs I've been seeing lately have had asking prices of from
$900-1100.

3624. fair price for used Tri-Ex LM-470 tower

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: rick258@ix.netcom.com
Message-ID: <855625898.16339@dejanews.com>

Hello -- I have the opportunity and desire to purchase a Tri-Ex LM-470 70 foot crank-up tower. A local ham has one he wishes to part with. The tower is approximately 2 years old and has a new motor installed due to a lightning strike. The tower is in excellent shape but has been welded to an existing base mounting. My question is what is a fair market value for the tower? I am not looking to "steal" the tower but also do not want to pay an excessive price. What are your opinions on its worth? The cost of the tower new was $3658 plus shipping.

73 and thanks for your replies Rick N5VVB

For sale: Custom built 4CX1000 amplifier. Consists of separate RF deck, control panel, and PS. RF deck uses motor driven vacuum variable cap and roller inductor, with potentiometer feedback for LED indicators on control panel. Will cover 10-160 meters, has input pad to prevent overdriving, 15 watts in will produce approx 1500 out at 3000 VDC. Control panel has large meters for plate voltage and current, bias voltage and grid current. Power supply components included but not built. Blower included and mounts remote of RF deck. Could mount entire system in rack, or use RF deck remote of operating position.

Prefer trade for legal limit desktop amplifier or ??? Make cash offer.

3627. more FT50R and SMA-3 antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: bobdavis@cadvantage.com
Message-ID: <855610155mnewsbobdavis@cadvantage.com>
Source record: 183630

I certainly left out some necessary informaton about the SMA-3
in my first post on the subject. Here is my first message:
=====
Here is my very subjective review of the SMA-3 antenna
on the Yaesu FT50R.

It works better than does the stock antenna, much better.

At the La Cygne Kansas hamfest, indoors, I could not even
hear the talk-in repeater on the stock antenna. With the
SMA-3 installed, the talk-in repeater (147.285) gave two
arrows on the S-meter.

So, even though the SMA-3 is *very* expensive, $41 at the
hamfest, I bought it. And now at home, it obviously performs
better than does the stock FT50R antenna on the local
146.985 repeater as well.
=====
And here is some information I should have had in that post:

The SMA-3 is the COMET SMA-3, made in Japan.

It does have an SMA connector for the FT50R or similar radios.

It does not have the small skirt to cover the shiny metal
adjacent to the case of the FT50R.

The SMA-3 is about three inches (8 cm) *longer* than the
stock antenna on the FT50R.

The SMA-3 is not as flexible as is the stock antenna.

Hello to all, I am selling a Kenwood TS-450 with built in antenna tuner. This rig belonged to a friend of mine who is now a silent key. This Radio is in absolutely MINT MINT condition!!! The radio has no more than 5 hours of use on it. This radio was brought new for $1250. I also found a Kenwood box with a voice module in it. I think it goes with this radio. I'll have to check. If it is for this radio it goes with the radio. The radio comes with mic and manual and the box if I can find it.
We are asking $900 obo.
If anyone is interested please e-mail me direct at:
mrusso@hoflink.com

Thanks, Mark N2FLF.

>Glenn
>N0VYK

I have an IC-720A. I got mine about 4 months ago and I like it. There
is a stepper relay that switches the low pass filters for the various
bands. This relay is VERY noisy; lound klunking when switching bands.
I am told this stepper relay is prone to failure. Mine is working OK
at the moment. I saw some info about a mod to eliminate the stepper,
but the info was not complete enough for me to go ahead and attempt
it. I can dig up the info on this if you are interested (I think).

The IC-2700H is known to have bad connections. I just sent mine back to Icom for repair of bad connections in the radio head that prevented the right side frequency and volume controls from working.

After getting the radio back, I decided to fix my mike up/down buttons which were giving me trouble. I had to press real hard for them to trigger. Inside the mike I found that the up and down switches were on a very tiny circuit board that was mounted perpendicular to the main board of the mike. The only electrical connection was solder bridges between both boards and 2 out of 3 of these had hairline cracks.

Keep checking for bad connections.

Martin:

You are correct although I would add that there *IS* a performance
issue...the '720A has the worst receiver Icom ever made. It's wide as a
barn door and none too sensitive.

>
Try Metricom (www.metricom.com I think).

They make the wireless modems for the Ricochet network. Here in Seattle
you can get a wireless internet account for $40 a month and the wireless
modems work at a rate equivalent to 28,800 at good locations, down to
about 9600 in poor locations. The system has repeaters on streetlights and
overall it works suprisingly well. Range is 1/4 to 1 mile.

The modems can be set up (with AT commands) to work in pairs so they only
talk to their mate. They work in the unlicensed 900 mhz band and have 160
spreading codes (ie channels). I've never tried this since I only have one
wireless modem. They can work with DTE rates up to 115 kbps so you
probably won't need a seperate baud rate buffer. Also you can enable
built-in RSA encryption if your LAN data will be flying back and forth.

Only problem is the cost, about $600 each. I rent mine for $10 / month as
part of the Ricochet service. Maybe you can rent a couple without the
service.

Hope this helps.

Source record: 183643

Does anyone know of a program I can download or buy that will allow me to use my sound-blaster compatible computer sound card to decode and display CTCSS tones on the screen? The concept seems simple enough...use a low band-pass audio filter system, and identify which tone (under a certain CTCSS high limit) is coming through. Seems simple, but has anyone done it? Or, better yet, heard of a program that does it?

Source record: 183644

I started a comparison of the R-71 and IC-751 audio on this board.

Since, I have gotten some hints, but no specific
help for the 751 (Got some good info on the 751A, but
the circuits are different).

Has anyone enhanced the audio of their IC-751?

QST had a hint for the IC-765 (Dec 95 I think), that is, to swap one
cap in the coupling circuit from the detector to the
AF amp.

Has anyone performed this surgery on the 751?

Thanks a million. My ears are killing me :-)

Source record: 183645

I have a little 50 watt solid-state mobile hf amp (DARTZ brand) that I would like to modify to go up to 6m. The manufacturer claims it's range is 2 MHz to 50 mhz but it seems to only work well up to 30mhz. The power transistors are TRW pt9796 7616 c. There are two of them. There are two clusters of toroids with multiple turns of wire running thorough them it looks like a toroid set in the input and also on the output. One set has two rows of six toroids with four turns of wire running though it (larger of the two) and the other is two rows of three toroids and has three turns of wire running through them (smaller of the two). There is a 560pf silver mica cap that looks like it's on the output. Can I maybe change caps or change the number of turns of wire running thorough those toroids? Can these transistors handle that band? Would anyone out there know what can be done if anything to raise the operating freq. on this little amp? Thanks for any assistance. Bob.... KN6GA

I'm thinking about setting up a private base-transponder on 33cm to exchange signals with and to control a rig on 1.3M, 2M, and/or 6M so that I could transmit on, listen to the VHF bands thru the 33cm HT... PLUS using DTMF commands on the 33cm HT I could change frequencies on and program the VHF rig/s remotely anywhere within a 30 mile radius.

One problem is that I doubt there is such a thing as a 33cm HT, much less any transponder equipment for 33cm. Has anyone out there seen any?

From: Al <albert@snet.net>
Message-ID: <01b8b9ca$e9e63840$450a3ccc@albert>
Source record: 183652

The problem with the antenna is that the tuning slot was manufactured incorrectly. The fix is to increase the lenth by 1 inch tward the nearest end of the band. That is if the band is streched flat in front of you with the tuning slot to your right, elongate the slot an additional inch to the right. The band is made of aluminum and is not difficult to cut or drill. After modification, the antenna works very well, tunable to 1:1 down to 50.0. I have mine tuned for 1:1 at 50.125 and get 1.5 to 1 from 50.0 to 50.3.

We are currently writing ham firmware for some Nokia PMR radios that have built-in CML 1200 bps modems for signalling.

I have seen ads that some Yaesu and Kenwood equipment have digital code squelch options. We'd like to make our firmware compatible with them. Does somebody out there have the spesifications?

Just wondering, does the problem go away when you disconnect the
antenna? Its not clear from your post if you determined if the problem
was in the radio or not. If the problem is in the radio does switching
the rx preamp on and off help the problem? Any computers near the radio?

73 and hope you solve the problem.

>
>Jim

Hello Jim- and all-
The 751a is a tight RX but I personally don't like it.
Here are a few tips to help it out. If the unit uses a first mixer
composed of seperate diodes. Those can be replaced with Shottkey
diodes to lower the noise floor. (I just checked and I have a set
of matched super-low noise diodes) Secondly, Icom used to use a
low quality audio output device which had lots of high frequency hiss
and nasty distortion. This contributes to listening fatigue.
I would take the Line level audio out from the rear panel and run it to
a good audio amp with tone controls or better yet an equalizer.
A good 6x9 speaker in about a 1 cubic foot enclosure would give you
supurb audio in the voice range.
I'd be glad to send you the diodes- Free. (thats the only pair I've got
left folks!)

Have fun!

3656. Yaesu FT-50R and SMA-3

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: bobdavis@cadvantage.com
Message-ID: <855586207mnewsbobdavis@cadvantage.com>
Source record: 183659

Here is my very subjective review of the SMA-3 antenna
on the Yaesu FT50R.

It works better than does the stock antenna, much better.

At the La Cygne Kansas hamfest, indoors, I could not even
hear the talk-in repeater on the stock antenna. With the
SMA-3 installed, the talk-in repeater (147.285) gave two
arrows on the S-meter.

So, even though the SMA-3 is *very* expensive, $41 at the
hamfest, I bought it. And now at home, it obviously performs
better than does the stock FT50R antenna on the local
146.985 repeater as well.

3658. Hands on Report: IC-756

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: Kreblon@ccwf.cc.utexas.edu
Message-ID: <5dnf4f$m3a@geraldo.cc.utexas.edu>
Source record: 183661

OK Folks- Here goes...all the little stuff you want to know
about the 756....well, maybe not everything.

I went into the only real Ham store in Texas this weekend with
every intention of buying a IC-756. I spent two hours with it
and an hour on a TS-870. Did I get the 756?...well no...but thats
cuz they wanted to give me $600 for my TS-850 trade in.
So here is the scoop:

First impressions:

The radio is smaller than it looks in the ads. The display is 4.9" wide-
not high as you are led to think. Its small...but not too small. The rig
is the same size as all the average HF bases. Things look well organized.
You notice the lack of buttons, but everything is there- its just in the
screen's menuing system. (which is very cool)
The "build quality" looks good too. Icom has stamped their name into the
top of the case...looks cool. This rig is an attractive unit.

Good things:
The NR mode on the IF DSP is very good. (It is not quite as good as the
775DSP) It is totally usable all the time on SSB. IT has very light phase roll
sound. It is also better than the NR mode on the TS-570 (which has serious Phase
roll sound). The AM filtering is a combo of 9 and 15khz filters...and sounds
very good. SSB reception is very tight...clear..crisp...but not enough
to give you listening fatigue. The RX has a low noise floor and sounds
"next generation". RTTY and CW reception is excellent...its the rig's strong
point. Even with just the IF shift, you can narrow things and dig
out the weak ones. I did not notice any in band de-sence blocking...and
it was RTTY contest weekend. The APF feature is nice on CW..it is not "real" peaky
but seems to add about 10db of peaking. Its very usable. The auto notch also
works well, and does not chop up the audio significantly when in use.
The display is nice too. It has a good viewing range vertically (which is where
you need it), but is not good side to side.
The menuing system is real nice. The 100 memories are listed like a paper list,
that is line by line with their names and info right there clearly.
The other sub-menus are easy to access and are fun to operate.

Bad things:
OK...I've got to add some nits here. The filter selection system is in the
menuing window. You have your two IF's filters listed in two columns. You then must
assign lines between them to give the way in which you would like to select
between them with the wide and narrow selections from the front panel button.
this is novel in its appearance, but means that if you want other than two
selections for filtering in any mode, you must go to the menu and change it.
No big complaint.

In AM- the PLL locks up a little slowly, and as you tune across the station,
you hear this buzzing sound each time it locks up. Distracting, but you
might forget about it with time.
SSb is too narrow for my likes. With a 2.4 in the first IF and 2.7 in the second,
you get that typical narrow Icom sound. There is no way to widen it out
just a little with good band conditions. There is a 3.3Khz filter available..
just another cost.
Dual RX is limited to the same band AND mode. It works...but is of limited
usefullness. Contests- yea...RX'ing RTTY and monitoring SSb on 20?..no.
(I hope I'm wrong on this - but I don't think so)

Now for the Spectrum Scope:
Is it cool?...Yup! You must remember that it is only a little over an inch tall.
Yes, you can see activity on the band (with a maximum 100khz width)
but it is limited because----the LCD refresh rate is so slow that if you
turn the tuning at anything over a crawl (like one rev per 5 sec)
the screen cannot keep up. You must be tuning very slowly to keep the display
active. This ain't no CRT. Its night and day between it and a real vaccum
tube pan-adapter. (a la' 781) It's more than a toy, and less than a serious
feature.

Conclusions:
Well, listening to the 756 is like listening to CD's for the first time.
Wow...thats crisp..accurate...digital...so precise....neat.
Then you listen to a rig like a TS-850 (the turntable) and you think...
Oh...now..thats Music! Top notch analog detection sounds pretty dam good.
(and the 850 is a very, very good rig)

So am I going to get a 756? Well, - My turntable is out in the garage.

So there you have it. I don't work for Icom...or a dealer...and I apologize
for mistakes...this is only one man's subjective look at the 756.

Take care-73's

Bob Nagy

Hi, I have 10 very nice late model GE speaker mics for sale.

They each have a three position (volume I think) knob as well as a red "emergency" button on the top as well as the standard PTT switch.

These would make great speaker mics for your handheld. All you have to do is cut the plug off and place the proper one for your radio. I plan on using two of them for me Icom and Azden Handhelds.

I don't know what radio they were made for but the model number on them is: 344a4189p12

Again, these are really nice looking speaker mics.

I am asking $15 each or $25 for two plus $3.00 for shipping priority mail.

Thanks,

Scott Sidener N0WFL

>Can anyone tell me which is the better unit and why?
>All opinions respected and appreciated.

It depends what you're looking for.

The IC-W32 is a true dual band with independent volume and tuning knobs
and simultaneous receive on both bands.

The FT-50R is a twin band which only listens to one band at a time but
switches bands if it detects activity on the secondary band. It's also
quite different as it's more rugged (it conforms to some US Army MIL-STD)
for outdoor and hard use. One dealer I was talking to threw it on the floor
in front of my eyes! It was unharmed. It also seems packed with features
and is cheaper than the IC-W32.

As I read the brochures however, I like the FT-51R more and more...

>transverter output from the 735 is very low (10 mW, I think) - too low for
>most transverters. The separate RX antenna input to the 735 is a real
>blessing for transverters, however.

The output at the transverter jack is much lower than 10 mW. 10 mW is
what most available transverters want to see, but the 735 puts out less
than a milliwatt. The reason for this is that the transverter output is
tapped off the pre-pre-driver stage instead of the pre-driver stage so
the transverter port can be used transceive.

As long as you're going to use the separate Rx input anyway, you can fix
that. The cable going from the pre-driver on the main board to the driver
on the PA board is the right level to drive most transverters. Just unplug
this cable from the main board, and plug the transverter jack cable in its
place. Now you'll have about 10 mW at the transverter jack on the back, but
you can't *transceive* on this port anymore. (That's Ok, you're using the
separate Rx port to receive.)

If you add another jack to the back, you can route the cable going to
the PA to it. Then to restore the radio to normal operation, all you
need to do is put a jumper on the outside on the back between this new
jack and the transverter out jack. Simple. This way you can never over-
drive a transverter, and you'll have the right level for most modern
transceiver designs.

I don't know what Icom was thinking when they set the radio up this way.
Perhaps they had plans, which never materialized, to offer transverters
for it which required the lower drive level. Anyway, after this mod,
it is a wonderful radio to use with transverters.

: What is good in a $300 price range....???

To do all that you've listed above, nothing exists in that price range.

For SW listening I'd go with the Sony ICF2010 portable. It's a top
portable SW reciever which performs better than some tabletop models.
Very easy to use and, as a bonus, it also recieves the air band, and the
extended Japanese FM broadcast band as well as commercial AM & FM.

There are only a handful of SW recievers of any kind made anywhere in the
world which out-perform this little wonder. (If you get one, look into the
replacement filter set from Kiwa Electronics - they turn a really good
radio into a great one. A really fabulous product!)

3675. TS-940 PLL Unlock repair hints

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: Andy Vavra <avavra@erols.com>
Message-ID: <32FF7D14.487D@erols.com>
Source record: 183678

PLL unlock in the TS-940 has been a known problem. Kenwood SB's 900 and 908 deal with two probable causes; low VCO voltage, and PLL voltage set-up.

In the amateur community, a third cause has been noted and in the case of my particular radio (7 million s/n) solved the unlock problem completely. Several well-known (non-Kenwood) repair agencies, and several technically skilled amateurs pointed to cold solder joints in the VCO located on the PLL unit. This suggestion was later implemented after following the process below.

Prior to working on the radio, reference readings were taken at TP-5 and TP-6 on the PLL unit. L17,18, and 20 - 24 were adjusted for maximum per Kenwood SB 900 with the PLL voltage being measured at TP-5 using a 100 mHz oscilloscope. Also, L34 was adjusted, on the advice of another amateur for a reading of 7.5 Vdc measured at TP-6. An interesting point to note is that VCO voltage at TP-6 when set at 7.5 Vdc, jumped to over 14 Vdc when the PLL unlocked. This further supported the "bad connection/cold joint" theory.

While both fixes suggested by Kenwood in SP 900 and SB 908 produced some improvement with PLL lock, the VCO instability was still present, and the PLL still unlocked occasionally. The conditions only occured when the radio was completely cold, indicating some kind of thermal relationship. Furthermore, when alternately heated with a heat gun and cooled with freeze spray, the problems could be produced at will. Heating and cooling were applied at different areas of the PLL unit, finally settling in the lower right quadrant near L34.

To make the repair, the PLL unit PCB was removed from the radio, and all solder joints in the area of the board surround L34 were retouched with a hot soldering iron and good grade of electronic solder. In addition to solving the unlock and instability problems, the VCO voltage at TP-6 dropped to 4.8 Vdc from an initial setting of 7.5 Vdc. This was interpreted as indicating that the VCO was now properly loaded and oscillating correctly.

The adjustments suggested by Kenwood in SB 900 and 908 were repeated and the radio reassembled. To date, the problem has not reoccured.

This repair worked inmy particular case, however, I can not guarantee that this fix will work with every case of PLL unlock. Repairs should ONLY be attempted by technically skilled individuals who have the proper instruments and Kenwood Service Manual. NO guarantees of accuracy are implied and if your repair fails, I disclaim all responsibility.

Message-ID: <5dnskp$n9o@camel0.mindspring.com>
Source record: 183682

Hi All,
I need a 10mtr crystal controlled CW transmitter strip for a beacon project. No more than about 5watts out, and 12vdc powered. I am looking for something similar to the kits advertised in the ham mags for 20,30,40,and 80mtr strips, But I need 10mtrs.

Anyone with one of these to sell, or a source to buy them would be GREATLY appreciated. I would prefer pre built unit (I don't have a lot of time for kit building these days) but a kit will do, I have exhausted my sources!

Thanks >>> Doug

3681. Update on the "exploded" Yaesu FT-101E

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: spammers@must.die.com
Message-ID: <wsandersE5EJuB.CEJ@netcom.com>
Source record: 183684

A few weeks ago I posted on an old FT-101E I was working on that made a large bang. I'm happy to report I found the source of the flashover and at least the receiver section is working, although there are problems with the transmitter.

- The receiver problems seem to have been solved by the old IBM PC trick of removing and reseating cards in their edge connectors. A basic alignment helped a little, too.

- The flashover happened where a big fat wire from the emitter of one of the power inverter transistors was touching one of the 117VAC terminals of the main transformer. The insulation broke down (there were visible scorch marks on the wire); the condition of the transistors is unknown but I have no intent to ever operate the unit off 12VDC anyway.

- Upon initial test, the transmitter would not tune up or produce power, and on 40-160M, drew excessive cathode current. Inspection of the final compartment revealed a wire that had become unsoldered from one of the gangs of the loading variable cap due to a combination of a cold solder joint and mechanical shock. The wire was soldered back in place, but there are still problems with the transmitter.

My questions relate to the transmitter operation now:

- The transmitter still seems unable to develop more than about 80W CW output, at about 300 ma cathode current. Is this normal for an FT-101E with aging tubes? Well, 300ma at 600V is 180W - that other 100W of power is going nowhere except in helping to burn up my tubes. The final stage seems to be neutralized OK as per the instructions. Do I need new final tubes or a new driver tube? Where can I get these 6JS6C tubes these days anyway?

- The manual isn't really clear what the maximum cathode current is supposed to be at maximu power output. The only clue is restrictions to avoid spurious radiation on 160 and 10m, with currents of 140 and 180 ma, respectively, for those bands.

Another clue: The "loading" adjustment has no effect into a dummy load on the higher bands. 40M and below there is some peaking, but none on 20 or higher.

Any help. comments, are appreciated...

-wiley KF6IIU

3683. FS: Yaesu FT-23R 2M HT

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9702101118358254@atdbbs.com>
Source record: 183686

Selling FT-23R outfit for a fellow American Red Cross volunteer...Yaesu's original 2-Meter compact handheld, with LCD display and S-Meter, up to 5 Watts on 12VDC, 10 memories (with 7 storing odd splits), and aluminum alloy case with water-resistant seals. This unit is in excellent shape. The owner bought herself a dual bander, and doesn't need this HT anymore.

Included Options (current HRO accessory prices in [ ]:

- CTCSS encode/decode (FTS-12) [61.95]
- Extra FNB-17 (7.2v) battery and wall charger [52.95]
- FNB-11 (12v) battery and wall charger [65.95]
- DTMF keypad ((FTT-4) [59.95]
- Dark blue (REAL dark blue) leather-ette case [22.95]
- Car window hanger [17.95]
- Speaker-Mike (MH-12) [45.95]
- Mag mount antenna. [29.95]

I'd prefer to sell it face-to-face to a Southern California-area buyer (so you can see it and play with it and appreciate it before you buy).

I believe $225. is a fair price for the outfit. Let me know what you think. Either send me EMail or call me at the addresses/phone numbers in the tagline.

Radio Shack will unveil its new dual-band HT - the HTX-204 - next month
(Catalog Number 19-1124).

-Compact size (NOT the config. of the HTX-202/404 by ANY means!).
-120 total memories (2 x 60).
-2 Call channels (US frequencies).
-Large, backlit LCD screen.
-Six character text display.
-DTMF 15 character memory x 10.
-Cross-band repeat.
-Clone over the air.
-Seven scan modes. 3 Hold types.

At 12VDC:

High = 5 Watts
Med = 2 watts VHF / 1.8W UHF
Low = 350mW

With supplied 7.2V battery:

High = 2W VHF / 1.8W UHF
Low = 350mW

-Four modes of dual watch.
-15kHz steps.
-Programmable battery save...as low as .20mA.
-Low battery indicator, auto power off.
-RF attenuator for each band - programmable.
-Auto repeater offset

...and more.

3701. Re: ICOM 735 & Transverters?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-10 00:00:00 UTC
From: Erik Skovgaard <Erik_Skovgaard@bc.sympatico.ca>
Message-ID: <01bc1714$94db0e20$2ec56cce@default>
Source record: 183738
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Joe,

I tried it using a Hamtronics transmitting and receiving converter. The transverter output from the 735 is very low (10 mW, I think) - too low for most transverters. The separate RX antenna input to the 735 is a real blessing for transverters, however.

I found the sensitivity a little on the poor side on 10 meters. However, a good preamp on the transverter fixed that (and that is the right way to do it, too). Overall, the 735 is a very good rig to use on the back end of a transverter, but you may have to boost the transmit signal. I used the main antenna output (instead of the transverter output) and an attenuator. I did manage to blast 100 into the transverter a few times, of course :-)

Yes, the oranges and apples are now showing their true colors.

Can anyone comment on the performance of either of these two units, and secondly, what are the contrasting points I should look out for when considering one or the other.

Is there one clearly better? It seems to me they are very comparable units. Never owning an HT, the nuances are not evident to me.

Thanks again, Jon

Hi Carl,

Not a good radio to be trying it with. However, grounding pin 14
on the accessory connector will extend the frequency ranges to:
160 - 1.0 - 3.0 MHz
80 - 3.0 - 5.0 MHz
40 - 7.0 - 9.0 MHz
20 - 14.0 - 16.0 MHz
15 - 21.0 - 22.0 MHz
10 - no change, sorry

I own a 756 and I think it is fantastic. It is true that the DSP is not actually working at the IF frequency, it is in the IF section but it processes audio data. So they are kinda fibbing when they say it is an IF dsp. A man would make a mint on a DSP that could actually work at IF frequencies.

It is an AF dsp. It is located in their IF section though. They kinda
trick you.

> I need a small 440 handheld transceiver. Anybody have experience with
> the Alinco
> DJ-S41T?

I just got mine in the mail yesterday! works great!

I was looking at the remote control mic for my Yaesu FT-5100 so
I can run around the house w/o being "chained" to the radio in the
shack. This remote mic is infrared!, line of sight only- cost:
~$100.00 and I recalled the Alinco rig only ~$139.00 at AES.
So, I bought one! great value- runs off 3 AA batteries and if
you use it to cross band off of your mobile/base - WOW you get
a "powerfull" little handheld! No, you cant remove the Ant.-
but YOU DON'T NEED TO ! this only puts out 350mW- I can "hit"
the "local" (~35 mi) repeater with it, but it's target market is
going remote from the house and/or car- for this (again) works
great. I got excellent audio reports and good coments on it
already.

In my belief, Alinco is catchin some of the big guys with their
"pants down" with the release of this and the DX70TH- look out!

happy shopping, 73 de Phil K6LS

> user@steh.softnet.co.uk

First, the manual can be ordered from the UK distributor. I don't know
of an on-line manual.

The only programming software is sold by Yaesu, and developed by RT
Systems in the US. It is the ADMS-1C software which includes a RS232
connector that connects to the mic jack of the FT-50R.

For a great link to a webpage that supports the 50R, here it is!

http://members.gnn.com/hca/ft50/index.htm

Have fun! It is the most versatile radio I own!

>If you still want the functionality of the Icom rigs, the newer
>IC-2350H and IC-2710H have attenuators built in on the squelch knobs.
>Although hardly a good solution, but it does reduce the problem when
>use (turn pass 12 o'clock)

From personal experience and even a salesman for a amteur dealer
admitted that the IC2000 is not very good at rejecting intermod. It
is better than some of the worst, I have found it to be only a slight
improvement over the Kenwood 741. However its out of band recieve is
better. Some say that the Standard 5718 is one of the better at
rejecting intermod, I have no personal experience.

Mike,
This is a matter of a simple IF filter replacement for most
scanners. Although wideband IF filters are not available at your local
Radio Shack, they are available from several mail order places. A
detailed description on how to do this appears in the Weather Satellite
Handbook by Taggart.

Suggest take a look at the newsgroup: sci.geo.satellite-nav
for suggestions/www sources/evaluations of current GPS equipment
From what I see there, the Garmin 12XL qualifies.

Are you into HOT CHAT? We've got the world's largest voice-personal dating system, as well as the hottest, sexiest "1 on 1", "2 on 1", and "PARTY-LINE" chat you'll find anywhere, all in one place! And you don't have to call a 900 number to get in on this hot phone fun!

You can choose from 5 hot programs that are sure to fulfill your every desire!

You can press 1 from the main menu to choose from our sexy "1 ON 1" PLEASURE MENU, then:
*to talk to a BEAUTIFUL SEXY GIRL, press 1.
*for a 1 on 1 session with an experienced DOMINANT MISTRESS, press 2.
*for steamy talk with a LUSCIOUS TRANSVESTITE, press 3.
*for an erotic 1 on 1 chat with an EXOTIC TRANSSEXUAL, press 4.

*for some man to man action with a HOT GUY, press 5.
You'll be billed just $3.99 per minute for your selection.

Or you can press 2 from the main menu to DOUBLE YOUR PLEASURE, then:
*to speak to 2 HOT SEXY GIRLS, press 1.
*to get it on with a swinging WILD COUPLE, press 2.
You'll be billed just $4.99 per minute for your selection.

Or you can press 3 from the main menu to join the GROUP ORGY LINE!
*You can party with the nations nastiest swingers for only $2.50 per minute.

Or you can press 4 from the main menu, then:
*Press 1 to join the FANTASY NETWORK. This is the world's only phone service that allows you to connect with people who share your personal fantasies. This state-of-the-art voice mail system lets you listen to messages from beautiful girls, sexy transvestites and she-males, gay and bisexual males, and dominant women. Leave them a hot and sexy message, then call back to see what erotic message they have left for you. You'll be billed just $3.50 per minute.
*Or press 2 to listen to a hot selection of recorded fantasies steamy enough to make you explode! Choose from beautiful, sexy women's fantasies or domination stories. You'll be billed just $2.49 per minute.

Or you can press 5 from the main menu for the HOT AND NASTY DATELINE, where you can listen, and respond, to voice personal ads from hot horny girls in your neighborhood, including their real names and home telephone numbers! You can also leave your own personal message for people to get in touch with you. Make new friends on the world's busiest voice personal lines! Meet singles or couples, gay or straight; you'll be billed only $2.99 per minute.

***JUST CALL 1-800-756-3906 to use your Mastercard, Visa, or American Express card. The charge is just $2.49-$4.99 per minute, plus a 50 cent connection fee. 18+ only.

***OR CALL 1-900-745-4398. The charge is just $2.49-$4.99 per minute. Must be 18 years of age or older.

Call now!!! YOU WON'T REGRET IT!

I repaired a Johnson matchbox (275W version). I don't know the correct
place for the input coil tap. I have it placed slightly more than two
turns from the ground side of the coil. (the other end is left open).
This tap is made by soldering a wire from the coax input connector. I
don't need to know the tap for a second receiver, that tap is adjustable
and is closer to the open end.
Thanks in advance,
Shel Darack WA2UBK shel@lucent.com

Yes, it's a tough little versatile radio. I have two of them.

Just don't drop it like I did last week - with the antenna off, onto concrete. It smashed the SMA connector. Back to Yaesu for repair/replacement of the connector.

Don't know how much it's going to cost me yet.

Joel-

Back in the 60's, several of my friends had the Lafayette HE-45A, when they were a current model. They all had the same low modulation problem. You might be more successful by taking the approach of looking for a design deficiency, rather than trying to fix a "broken" radio!

I always wanted to get my hands on one of them, to see if I could figure out where the problem was. I would have tried feeding the microphone circuit with an audio oscillator, and looking at the audio stages with a scope.

The first test, would be to increase the audio level until the modulator started to saturate, and see if it was capable of close to 100% modulation. If not, and an earlier stage didn't saturate first, then the modulation transformer turns ratio might be incorrect. As I recall, it used a tapped, single-winding modulation transformer, in an "autotransformer" configuration. (I don't remember if they used the same stage for receive audio. If so, then there may have been an additional speaker winding.)

If the modulator is capable of close to 100% modulation, then it may be possible to change load resistor values in the earlier stages, to increase voltage gain.

At least in theory, the modulator should have been capable of producing enough audio to come close to 100% modulation. I don't recognize the tube number 7868. It may have been a tube used in the newer "B" model, in an attempt to increase modulation. I think the older one used a 6AQ5.

Keep in mind that hearing is logarithmic, and most people's voices only reach an occasional peak without speech processing. A rule-of-thumb, is that average speach is 10 dB below the peaks, for "broadcast quality". Most two-way radios are set up so that voice peaks are limited, and average modulation is relatively high (maybe 50%). If it sounds weak compared to other signals, it is probably quite low in terms of average percentage.

I one of you with a little technical assistance could assist I would appreciate. I am not a radio technician at all; I am a radio user. I do know enough to conceive that this is two problems.

1) How do I increase AM radio reception to pick up a station that is just out of reasonable reception from standard car or home receivers?
2) How do I pick out a signal on FM from car or home; that is currently barley audible in car only, and is wedged in-between two local stations.

Thanks for any "feedback".

>going cross-country. Not everyone wants their CTCSS freq published in the
>repeater directory.

The 733 will display CTCSS tones being received ONLY IF the optional
TSU-8 board is installed, according to my instruction manual.

The Icom W32 ht will display the frequency of received CTCSS with its
"tone scan" function, no optional hardware or software required. Its value is
questionable, in my opinion. Many repeaters require a CTCSS tone on their
input frequency to key-up the repeater, but same tone is not transmitted on the
output frequency. So to display the tone frequency you must be close enough
to a rig transmitting on the repeater input frequency.

Today is usesd my scanner Bearcat UBC 9000 XLT and the program WXSAT
(soundblaster) to receive NOAA pictures.
It works GREAT !!! I get the compleet pictures, a friend of me have a
real NOAA receiver and we putt the two pictures together and they are
the same. So my scanner works great to receive weather sattelites on
+137 Mhz.

No modifications on my scanner, and i use a normal dualband antenne for
144 Mhz and 440 Mhz.

If you don't mind, when you get it back, let us know how much they charged... I'm just curious, because I know 530 owners that got shafted for replacing a BNC.. I also know an Alinco 580 owner that replaced the BNC and two knobs, and it cost $80. I'm just curious if you don't mind posting it publically.. thanks.

Dave:

I used a friend's rig and didn't find it quite as awful as you describe. The original IC-720 was far worse. It IS possible, however, that the rig I played with was modified, or that a service bulletin had been applied, since the rig had passed through several owners' hands.

BTW, to Glenn: You get what you pay for, and there is definitely a reason this rig doesn't hold it's value. If you don't absolutely, positively need general coverage, I'd recommend the next two Icoms to hit the market, the IC-730 and IC-740. Both have excellent receivers, and are durable. I have a circa 1983 IC-740, which still performs brilliantly. Best yet, many of the accessories and options for these rigs are now on closeout, either from dealers or Icom directly.

Good luck & 73,
Martin

Dave Burr wrote:

(Best Icom rigs ever:) It is generally agreed that this is the '761 or '751A, from a receiver standpoint.

Dave and all on the net:

These were great radios, but some minor disagreements. I have a close friend who now owns an IC-781, and had an IC-751A at the same time. I do think the IC-781 has a better, quieter receiver, but is it worth several times the price? In addition, the twin passband tuning is extremely sharp, and makes it much easier to sort out signals than was possible on the 751A. The 751A and 761 DO outperform the IC-765, however, and by quite a bit.

Another little shock for you... The last non-general coverage rig Icom made (the IC-740, which I still have) has a quieter and better receiver than the IC-751A, both in terms of subjective A/B listening, and objective testing with a Cushman.

For my money, I think the IC-761 is probably the best value in a used Icom rig, though I honestly haven't had the opportunity to play with the latest generations (IC-736/737/738/756/775). I also believe that all the Icom HF rigs since the IC-730 (with the possible exception of the IC-725/726) have been very decent, at least in their class.

I really enjoy this thread about abused FT-50s

I was playing tenis with a friend when we ran out of balls so I served my FT-50R to my friend. We vollyed for half an hour before I hit it out of the court on a wild swing. A dog grabbed it and ran away. An Aligator ate the dog and a poacher nabbed the gator. The poacher returned my radio which worked fine and still had some juice left in the battery.

Gosh its a rugged little radio... Baw haw haw.

Next week: How my FT-50R got mixed in with the 4th of July fireworks.

>the output on this radio drop because the tx is open like the 450?
>thanks
>mike

A stock TS-430S only does about 85 watts out on the 10 meter band, and
possibly in your case, 11 meters. If you feel the need for a few more
watts, take the top cover off and find three holes in the top of the
PA module cage in back. One of these is the ALC limit. Screw around
with it and you may get more power.

I need a small 440 handheld transceiver. Anybody have experience with the Alinco
DJ-S41T? I have the Standard C508A which is smaller, but the 2X price difference
leads me toward the Alinco for a second radio.
Comments?
Is the folding antenna detachable so you can use an external?
Thanks, miker

Boy, you expect a lot for 79 bucks! Its great for tracing audio circuits, replaces a logic probe in slower systems, and , of course, is a damn handy Volt meter. It would be nice to have an internal battery, but it does work fine clipped to 9v battery. You seem to expect a lab-quality scope, but miss the point: its a great portable piece of equipment to have handy when you need it. Mine sees daily use.

I am new to ham radio (still studying for the Novice!) and have been following the threads on the close-out of the Radio Shack 440 hand-held radio.
I am considering this model as the type to get; since this would be my first radio, I am very interested in getting any input (Pros and Cons) on this model from those of you more experienced in the field.
Thanks for any input you can share on this matter. Remember, this would be a start-up radio for a start-up operator!

That CTCSS adjustment that is refered to is actually the reference oscillator capacitor. Don't tweak this one unless you have an accurate frequency counter.

From: Wink <wink@rpa.net>
Message-ID: <3300E148.33B7@rpa.net>
Source record: 183539

Hi, thanks for reading!
I'm looking for people that have used the Force 12 C3 antenna over a northern winter season. My question is, how does it hold up under ice loading and wind? Also, how does it compare to other tribanders that you've had up before?

I had the great fortune to be in Phoenix last week (the warm weather was wonderful!) and stopped by HRO. They had one on the roof so I got to actually see one. The element tubing looked a bit smaller and more tapered than the TH6DXX that I've had up since 1979 and is truly on it's last legs, if it even makes it through the rest of the winter. The C3 looks more flexible that's why I am wondering about ice loading.

Thanks again!

ptracy@aol.com wrote:

>Well done! Ditto.

There is no question that Ten-Tec goes "all-out" to
satisfy the customer and be responsive to feed back.

However, it only make good business sense to utilize
EVERY available resource to advertise one' products
and create good will.

What the big ham radio companies apparently don't
realize, is that monitoring the user groups and actually
participating in the discussions is an INVALUABLE
source of feedback from John Q. Ham regarding what
is needed, wanted, etc.

It's inconceivable that the marketing types at Kenwood,
Yaesu, Icom, etc. have not acted upon this.

I bought one about 3 weeks ago, and love it. There is no mute, but otherwise the unit is exceptional. I have not had any trouble with intermod. I have not used the memory autopatch, but have used the patch otherwise, without problems. I really love the fact that you can read the manual once, and then put it away. The radio has a guide function if you get lost. I love it. The candy store didn't have the remote panel kit, so I installed it in my shack. I now want another one for my mobile. I'm selling my other VHF/UHF stuff, both mobile and in the shack. And no, I don't have anything to do with KW, I'm just a very satisfied customer. Now, if a US company could build something this nice....

>--
>Vartan

I can understand the perplexity between an 32 and a 50, it was a hard
choice for me to make too, but I went with the 50 and have been happy.
However, between the 32 and 51, you definately want to go with the
32... cheaper, more features, better audio,etc., etc., ... Don't get
me wrong, I really liked my 51R, but I feel the 32 is a better radio..
As for the decision between the 50R and the 32A, that's a hard choice
that comes down to features, etc.

Hey, I didn't get schematics either with my V7. I asked the candy
store where I bought it, and they said it is common to not get the
schematics with a new radio.

I want em, I paid for em, so what's the deal!

Kent - de KC5WPW

> wall as I could, keyed it up, and it wiped the audio out completely.
> For some reason I could not hit the repeater that day, but sure was
> fun trying.

Once I was waiting in line at a Pizza Hut and talking simplex to a friend
at
the other end of the mall. I noticed that whenever I keyed up the cash
register
beeped. When I got right near it I keyed up to ask my friend what she
wanted
and the register display went BLANK. Actually I crashed the entire system.
Did you know all the register were interconnected? I didn't. When they
restarted the system it insisted on printing the day end receipts which
took
quite some time. Despite them seeing me key up they had absolutely no
idea I caused the problem. I have since refrained from using the ht near
electronic equipment that has the possibility of delaying lunch.

3785. Anyone have a 1948-1955 U.S. Callbook?

Newsgroup: rec.radio.amateur.equipment

There is a different set of rules in Europe than here in the states.
That means different privileges as well as different bands.

Europeans do not deal with the same Alinco as you and I in the U.S.
so you can't look at something on a European web page and expect to
see that same radio here in the states.

Hello to all, I am selling a Kenwood TS-450 with built in antenna tuner. This rig belonged to a friend of mine who is now a silent key. This Radio is in absolutely MINT MINT condition!!! The radio has no more than 5 hours of use on it. This radio was brought new for $1250. I also found in a kenwood box with a voice module in it. I think it goes with this radio. I have to check. If it is for this radio it goes with the radio.
We are asking $900 obo.
If anyone is interested please e-mail me direct at:
mrusso@hoflink.com

Thanks, Mark N2FLF

```
==========================================================================
Radio Shack will unveil its new dual-band HT - the HTX-204 - next
month (Catalog Number 19-1124).

-Compact size (NOT the config. of the HTX-202/404 by ANY means!).
-120 total memories (2 x 60).
-2 Call channels (US frequencies).
-Large, backlit LCD screen.
-Six character text display.
-DTMF 15 character memory x 10.
-Cross-band repeat.
-Clone over the air.
-Seven scan modes. 3 Hold types.

At 12VDC:
--------
High = 5 Watts
Med = 2 watts VHF / 1.8W UHF
Low = 350mW

With supplied 7.2V battery:
--------------------------
High = 2W VHF / 1.8W UHF
Low = 350mW

-Four modes of dual watch.
-15kHz steps.
-Programmable battery save...as low as .20mA.
-Low battery indicator, auto power off.
-RF attenuator for each band - programmable.
-Auto repeater offset

...and more.

Tony's For Sale/Trade List Ver 1.1 ;)

Newbie needs to build up a shack.
Looks like we're running low...lemme throw some more stuff in the mix.

Professor SF2 Super NES Backup Unit $175
Brand-spanking-new Super Nintendo "Backup Unit." 32 MBIT. Buy at
asking price, and I'll throw a few games in. Bought it a few weeks
ago for my kids, now they want a nintendo-64. I told them this has
to go. Has box,book,perfect like-new condition. I'll even throw in
the software, and cable to hook it up to the PC, which cost extra!
This thing will even do Donkey Kong Country 1,2,3!

GENUINE IBM 9371-110. MicroChannel/370. $1500/OBO
Yup. You read correctly. This is sort of a "Developers's System" 370.
If you know what I'm talking about, you know it's a steal, If you don't,
then it's a ~250 pound 386/20, w/ 3MB RAM. 370 CPU has 8MB RAM on it.
Also, If
you know what it is, you know UPS won't haul it. Fits in the back of a
Bronco II,
BEHIND the back seat, though! ;) Has 3Com Ethernet card, IBM MCA SCSI
controller
with cache, IBM MultiProtocol Adapter (Sync/Async).

Banyan Vines Version 4.10/4.11 $250+MUCHO shipping
Has AT/MCA versions, plus all docs. Helluva shipping charge, though.
have a few keys, also included.

Box of Color Computer 2/3 stuff $200+shipping
Speech Synth, CC-80 Synth, Blank EPROM cartridges (ROMPaks),Eprom burner,
Video Digitizer, books,docs,ROMpaks, software,magazines,coco2, pupo KB
interface, *ALL* kinds of stuff! Floppy controllers,floppy drives...
Don;t wanna part it out. Wanna sell it out in one lump sum.

Box of MicroChannel cards. $500/OBO
Serious stuff. Digi MultiPort boards, Comtrol MultiPort boards, StarGate
MultiPort boards, 3 IBM ARTIC boards (2-512K, 1-1MB)(those are $250+/ea
USED),
IBM 2M VRAM XGA,Orchid RAM board, IBM RAM board, Future Domain SCSI
controller,
ALL kinds of stuff in that box!!!

DigiChannel/CX EISA system $500/OBO
with at least 32-Ports, possibly 48-ports. Doc's are there. works fine.

(74) 1MB 30Pin SIMMS for Mac (No Parity)- Offers?

Apple Newon MessagePad 110 System $OLD/waiting for $$$

Apple 2GS ROM-03 $300/obo
4MB RAM Card
Apple HS SCSI Card
External 80MB Hard Disk
Keyboard, Mouse, RGB Monitor
(2) 3.5" floppies
(1) 5.25" floppy

Apple 2GS ROM-01 Woz Edition $OLD

Apple MacSE $300/OBO
4MB RAM
80MB HD
Keyboard, Mouse, Power Cord
Runs Great, Looks OK.
Decent Packet Station. Used as one, now I use Unix.

Kantronics KPC-2 $75/OBO
Version 2.80 ROM (can be upgraded)
additional ROM: Kantronics G8BPQ Kiss ROM
Manual, and 2.80 addendum
HT cable, wired for Icom IC-W2A
AC Adapter
Runs good. Used until I got an MFJ 1278

Drake ESR240A Earth Station Receiver $OLD

See anything? no? How about a silver & black 1973 Porsche 914/4? $2500

Things I need/Want to buy/trade for:

1.Kenwood TSU-7 CTCSS Decoder board for TM-732A 2m/70cm Mobile
2.Yaesu FT726R/736R, Icom IC-820H/821H, Kenwood TS-790,
or other Full Duplex Satellite station
3. Ten-Tec Kits: 1220,1230,1260 (2m/1.25m/6m) (pref unbuilt, but built OK)
4. "personal" autopatch. one of the $100-200 (new) ones.
4.Bought and Icom IC-T7A, but will look at Yaesu FT-50R with some acc.

3799. Re: 900 MHz equipment?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-11 00:00:00 UTC
From: Ron Curry <recurry@insighttec.com>
Message-ID: <01bc17de$570a4280$5ba19ecd@expressp5.insighttec.com>
Source record: 183575

Ted,
I have not found any read to run 900mhz ham band HT's. However, I have modified Motorola MTX-900's. The modification is simple in concept but complex to implement:

1. Swap out the 935mhz preselector filters for 915mhz units.
2. The firmware isn't capable of allowing the radio to run below 935mhz or above 902mhz so I developed two completely different ways around the problem. The first is to change the reference osc freq. to move the synthesizer down for rx and up for tx. This requires having some custom xtals made and adding a second reference osc. (for tx) and switching between them on tx/rx. I made one radio work this way.

The second method (only partially working at the moment because I haven't had time to finish it) is using a PIC microcontroller sitting on the I2C serial bus that the MTX processor uses to program the synthesizer chip. It intercepts programming info, modifies it with an offset which puts the synthesizer into the ham band. This is the best one since it's simple from a hardware standpoint - I just need to finish the firmware. It's all in PIC assembler and uses a C84.

Regards,

Matjaz presented his 23cm PSK radio in Weinheim - Germany VHF Meeting.
So description is published in a script of this meeting.
If you want, write to me and i will send you a copy....

These radios are operating fine, mainly they are used for links
(operating over distances more than 80km)....

I think a company alled MuTec or something like that made frontends for
some radios. From what I have heard, good ones. Take good care of it!

If you can, try another serial port on the same computer or a different machine. My PK-232 on my MSYS BBS seemed to go deaf, and the problem turned out to be a bad serial card in the computer. I may well have killed it - I appeared to be using a 25-wire cable between the PK-232 and the DB25 serial port. The PK-232 uses some of the pins on its DB25 to drive a parallel printer using the "Y" cable. As I recall, the manual warns against using a 25-pin cable for this reason.

Good luck and 73,

Great idea Gary, but it defaces the rig. No help when bowwowing Joe's rig on field day. An easy fix is to make up a small buffer amplifier using a single transistor, e.g. BF981 or a modamp, operating in a linear mode (most important) to boost the low power to about 20mW. Then add a filter on the output to ensure a clean drive.

A level setting pot is a good idea as well so you can adjust the power input to the transverter, and while you are at it, a relay and two sockets to switch the receive line and the signal to the transverter pin on the acc1 connector.

Now you can leave the rig wired for HF and have the transverter connected. Change bands at the flick of a switch and protect the transverter from 100W of HF.

: In addition to the others already mentioned, let me add
: the discontinued Icom W2A which may be had for about $300
: on the average at ham fairs, or rec.radio.swap. It sports
: two separate displays for each band (VHF vs UHF).

: ray -
: N 47* 34'
: W 122* 18'
:

The poster wanted to monitor 2 frequencies in the SAME band...the W2A can
NOT do this.
I should know...I've had one for years (and love it), but I do know it's
limitations.
P.S. they cover full 800(with 30 Khz steps available, yet)with good
performance.
the mod is just a keypad sequence.
Actually, the same mod makes the unit a pretty decient scanner(although
it IS a bit deaf around 470(but the performance is still ok there).

Source record: 183342

I've puttered around with a set of Kenwood Twins I've had for about five years now-- it's the best $200 rig I could ever hope to find (the connector cable was bad, and made the rig act crazy when the two radios were linked. Literally, 20 minutes with a VOM and an iron, and it worked like new.)

Anyhow, I would really like to have a copy of the Technical Manual/ Shop Manual for the radios. Of course, I'm willing to pay your copying and shipping costs.

Can you help?

73, etc.

Nice receiver but the transmitter has a problem with
phase noise, icom is aware of this as the european
units have a mod kit.
on ssb a sig. 40/9 will have phase noise of s7
of 6 kc wide. my unit is at icom now waiting a fix.

On previous radios such as the TM733 and TM732, I believe Remote Control refers to external DTMF OR microphone DTMF control of the transceiver. I do not have my cheat sheets in front of me, but on the rigs mentioned above, a power-on keystroke is req'd to place rig into "remote" DTMF control.

My tentec story:

I called TenTec to clarify a matter that had me confused. It was in the late afternoon (PST) here, so I knew I probably wouldn't get an answer. I was surprised when the phone was answered after the second ring. I explained that I had a question regarding the proper operation of a certain model, and the person answering the phone allowed as to how I was talking to the right person because he had designed that particular radio himself. He spent fifteen minutes talking with me, and in answer to my question as to how he came to answer the phone, explained that he was working late and was just leaving when he heard the phone ring. How many other people -- especially at his level -- would have bothered to do that?

3831. Re: IC-W32A ..or..FT-50R ?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-12 00:00:00 UTC
From: f fuentes <mrvalidatr@earthlink.net>
Message-ID: <3301F766.E00@earthlink.net>
Source record: 183401

From the postings/mail I've been getting, it seems as though the 51R has more features when compared with the W32A. However, people seem to gravitate toward the W32A despite this for one reason or another, and the 50R remains a contender among these two radios which are distincly different (true dual-band vs. duo-band).

The most common reasons for the W32A:

"Fits better in hand"
"Icom is the better company and reputation"
"Costs less"

A decision is tough when you don't have an opportunity to play with the respective radios first hand.

Thanks, Jon

From: "Robert A. McKay" <Thule-APJ@postoffice.worldnet.att.net>
Message-ID: <33021F23.23D9@postoffice.worldnet.att.net>
Source record: 183407

Have a AZDEN PCS-300 2-meter handheld. Have not been able to use it for quite a while because I can't charge it. Is there any charger available, i.e. Radio Shack etc, that I can use to charge this unit and also use it from a 115 AC when not portable. I have lost the paperwork on it also. It worked great the last time it was running.
Thanks Bob

3838. Antenna/reception help, please.

Newsgroup: rec.radio.amateur.equipment

Message-ID: <eudani-1202971524490001@pm2s18.jorsm.com>
Source record: 183408

Hello,

I have trouble receiving Am and FM stations with my home stereo system. I live about 30-35 miles from Chicago and have *no* problems receiving stations with an inexpensive AM/FM boom-box. My stereo system has the usual wire antenna that has 2 prongs and may be hung from each one of these prongs. I can recieve about 3 FM stations clearly and I can barely receive AM stations at all and one or two that come in are full of static.

Can someone suggest a better antenna and where to get it, or a solution to this problem?

Thank you,
Ed

>
>73 Mike

Well, you can certainly do that, Mike. But 1) I don't consider adding
a jack to the back panel "defacing" the rig, and 2) if I'm borrowing
the rig it only takes a couple of minutes to remove the cover and move
the transverter cable over to the pre-driver output jack, and another
couple minutes to put it back when I'm done. No *permanent* changes are
required. This is the quickest, easiest, and cheapest way to allow the
IC735 to work with 10mW input transverters.

I'd use an external box only if it were imperative that neither radio
nor transverter be touched internally. In that case, your idea is an
excellent one. I'd likely use a MAR-4 as the gain element. Note that
you *could* tuck one of these *inside* the 735 or *inside* the transverter
as alternatives. That wouldn't "deface" either piece of equipment, and
eliminates another external box and another level of TR sequencing.

If you're using transverters with a transceive IF port, the best place
to put the extra amp is inside the transverter on the Tx side *after*
the transverter's internal TR. If you're using a transverter with a
split IF, many are this way, then putting the amp in the radio to bring
it up to "standard" transverter levels might make more sense. Especially
if you want to mast mount the transverter, then having the hotter signal
at the other end of the coax becomes very attractive.

There's nothing *wrong* with your approach, it is just that I'm reluctant to build yet another box when I don't have to. That's just more stuff you have to lug along, and another set of cables to add to the tangle, and possibly cause problems, and another level of TR switching to sequence.

Gary

>Ray W8RD (rayd@en.com)

Do you have a local battery ground problem? The cigarrette lighter is grounded to the chassis right there where you are taking power.

It is possible that the local battery ground connection is broken or corroded, and the next available ground for the battery system is the alternator ground, which you would get by default with a direct battery connection.

Just a rambling thought... it sounds like a ground path problem.

I had a IC-W2A (was stolen a while back) It was capable of monitoring
UHF and VHF simultaniously (both sides). But it was NOT capable of
monitoring TWO UHF or TWO VHF freqs simultaniously.

A friend of mine has a Kenwood TM-732 that has dual "inband" receive -
you can put TWO UHF or TWO VHF freqs up in the display and listen to
both at once. But it is not capable of inband full duplex operation.

Regards

3863. Help! Can't Get Out!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-12 00:00:00 UTC
From: "Brian W. Haren" <bharen@n-link.com>
Message-ID: <3302774C.5FC1@n-link.com>
Source record: 183433

I've got a 2 month old HTX-202. Until 2 weeks ago it was working fine. Then one day, without warning, it <apparently> stopped transmitting. The only way I had to tell something was wrong at the time was the fact that local repeaters I could easily get out to with a rubber duckie I could no longer hit even when I was within 3 miles of their location and working off of a 5/8 wave mobile antenna. I took the radio back to the Radio Shack store where I bought it, and they dutifully sent it on the Houston for service. It came back yesterday and with a service reciept saying they had fixed this and tweaked that, and "realigned it to specs". I took it home and attached the rubber duckie and... Nothing! Same problem. I can hear the repeaters, but I can't reach them. Not with the rubber duckie, not with my mobile 5/8 antenna, not even when running off my car battery at full power. So, I got out my SWR/power meter, hooked it up, and the meter tells me that everything is OK; I'm getting out at about 3.5 watts on the battery and a fair SWR (but all I had hooked to the meter for an antenna was a piece of coax).

So now I'm stuck. I can't hit repeaters I normally could reach with no problem, but my SWR meter tells me I'm getting out. I can hear the repeaters OK, but they can't hear me. Guys I could talk to on simplex can't hear me now. I'm new to this ham game, so before I take the thing back to the Shack (where their friendly sales people are clueless on ham gear), is there something I am overlooking? Or could there be an equipment problem that the service center could have overlooked?

HELP!

Clueless in Texas

Hi Ray,

I would like to know more about your intermod problem. i.e. what are you hearing? Is this 2M only (I am not familiar w/ your rig).
We have over 2000 of our filters in use. They are an asymmetrical notch filter with very low in-band loss (typically, under 0.5 dB loss), may be left in line on dual band rigs (under 0.25 dB loss @70cM), require no power and are rated at 50W.
If, after learning more about your problem I feel our filter is appropriate, I will mail you literature if you wish.

I have a new FT-5100 and when I hooked it to a cushcraft ARX270N antenna
I now have a itermod problem on 2m. I hear the 146.98 rptr on 147.34.
This didn't happen on a duel-band mobile ant. The base ant. is 16.5'
tall. Also hear misc trash on 145.800 mir freq (sql also trips off and
on presumably from other rptr stations)

3875. FS: 37' Telescoping Mast - $30 <San Jose, CA>

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-12 00:00:00 UTC
From: gvs@netcom.com
Message-ID: <33021e5a.85243654@192.0.2.3>
Source record: 183460
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.misc

<<< Sale in San Jose, CA. >>>

37 foot Telescoping Mast originally designed to support a 10-80 meter inverted-V, but could be used to support a small rotor and beam (28mhz up to vhf/uhf).

Material used is schedule 80 PVC Tubing, in 4 sections, with O.D's: 3.50", 2.75", 2.25", and 1.75". The sections are held in place by a u-clamp and thru center eye-bolt arrangement. Each u-clamp has 2 outer eye-bolts, along with the thru center eye-bolt, which are used as guy points.

The bottom 3 sections use PVC sched 80 reduction union joints (very beefy) which I reamed out to allow upper sections to slide thru freely. The three over-lapping sections are over lapped by 12, 16, and 18 inches, from smallest to largest dia., respectively. Each upper section has 2 sets of 3 spacer bearings that take up the excess play inside each over-lapping section.

As you may well have gathered, I have an Engineering background and took some time designing this Telescoping Mast. It wasn't something I just threw together.

The last 2 years in San Jose, CA, has brought storms with winds as high as 75 mph. This Mast barely moved during these storms. Also, I use three sets of guys which are marine-type nylon rope that is UV resistant.

Mast is more durable and can withstand higher wind speeds than a steel mast, when guyed properly. Also, Mast doesn't interact with antenna like a steel mast would.

My dad has an FT-990 and it does not do this in any normal condition. It certainly is possible that the unit is getting hot and the fan is cycling, but this is not normal, in my experience. If you don't have this unit in a cramped space and the ambient temp is normal, I would investigate further.

From: rayd@en.com
Message-ID: <5dre4h$oq5$1@news.en.com>
Source record: 183463

Here's a weird one... when my Kenwood TM-733 is connected directly to the battery, I get a horrendous whine coming in on the power leads (doesn't vary with AF gain). However, when the rig is hooked up through the cigarette lighter, the noise is barely perceptible. Obviously I can fix the problem with a choke, but what gives here? Are the power leads picking up something on the way? And why does the lighter jack seem to have filtered DC? Thanks in advance for suggestions.

When installing the NMO mounts on sheet metal, a greenley (sp?) hole punch works wonders. You drill a small hole, and then use this punch to enlarge it in one shot to the exact diameter for the mount. No bouncing around of the hole saw, and it makes a very clean hole. I think you can get them at an industrial supply/hardware store.

I put 3 antennas on my 89 s-10 blazer this way....

> in this forum!

I would love to hear from anyone interested in this subject. I am actively working on finding/building devices to use this band.

I'm supprised as well, and I'm *very* interested in this development! At the very least, I want a transceiver pair to experiment with a friend, 1.5 miles away (let alone my ISP, which is 3 miles away...). I'm picturing a transmitter/receiver interfaced to an Ethernet card in a pc, either via the AUI or TP ports. This shouldn't be too expensive, and would be of windfall benefit to have a 10Mbps Ethernet connection to the Internet!!! (Ethernet encoding requires 20Mbps bandwidth to deliver 10Mbps data throughput) The telcos won't be bringing us anything near this speed for a long time, and even then it will be outragiously priced. Cable TV companies won't do any better (except for isolated pockets), and again, they're overpriced. TCI receintly announced a big scale-back of their Internet efforts. Free airwaves are the way to go for a 'free' Internet! Talk about bypass!!! I love it for being able to give a thumbed nose and raspberry (complete with wiggling fingers!) to those that should have already provided us with reasonably priced, high speed communications. Such was the spirit that gave birth to MCI and countless (well, hundreds anyway) telcos and long distance carriers. RBOC's fear of losing overpriced leased line suibscribership has and will (IMHO) keep them from delivering high speed comms, allowing their lunch to be eaten (again!!!)!

Please contact me if you have knowledge of or interest in this NII development, equipment to use it, as well as the implied opportunities.

> band which stays in the car. Thanks for your help.
> --Bill KB8USZ william.a.ruthATOberlin.edu (return addresss
> modified in case of junk mail robot attack)

this is the mod I did with my DR610 to get extended rx/tx.
1. disconnect both the antenna and power cable
2. remove the control head
3. remove the 2 screws holding the control head together
4. gently separate the back cover of the control head from the front cover
5. locate the two jumper wires on the circuit board. One is RED, one is
BLUE. Cut both of these wires.
6. reassemble the radio and reset the CPU (Push and hold the Function key,
then turn the power on)
That's all!
Warning: modification may void your warranty.

Hello, I have for sale and Icom 27H mobile radio. This radio does show some use and has a buzz on rx that will last for a few minutes after you turn it on and then will go away and it won't do it again until next time you turn it back on.
Radio has 9 memory channels, 2 vfo channels, ctcss encode, memory-priority-vfo scanning, approximately 12 years old. Have been using it on packet for the last couple of years but got out of packet so I'm selling it.

I'm asking $125.00 (I'll pay shipping).

I can be reached at the following:
1(816)429-3791 or email at (mwise@iland.net)

Thanks for reading this,

My TL922A has been in storage for ~4 years now. I just pulled it out recently, and noticed a bit of xfmr hum when in the SSB (higher voltage) pos'n... without transmitting.

Check yours for me... is that the norm?

And, another question: anyone operated CW in this higher voltage position? I'm curious exactly what results you have had, and if you know positively what the design limitation is that causes Kenwood to say 3 times "DON'T DO THIS".

tnx

I got an E-mail message from a Dealer in the UK who has CONFIRMED the Alinco DX-71 will be out in June 1997. He told me that I am NOT confusing it with the DX_701 already available. The DX-701 has been out for about a year now. It is HF only with CHANNELS and no vfo. It is meant for the commercial market. No frills. The DX-71 will be a NEW radio! I have No Details about its features/Price but I will keep all informed! Cheers, Steve NS1R

What would be the best 40-20-15-10 antenna for an apartment dweller, at under $150? I have considered the MFJ 16010 random wire, and the MFJ 1621 portable whip/tuner. I am limited to a <20' vertical setup, or a sloper/wire up to 30'. So, what should I do? I am running a TENTEC Scout, 50W PEP.

I have an old Aea CP-1 that use to hook upto a Comodore VIC-20. I no longer have that VIC-20, however I now own a IBM compatable computer. On the rear of the VIC-20 is a RS-232 port.
I have connected the computer to this, and when tuning into a rtty or cw station I recieve
a bunch of garbage. I do not know if I do not have the com speed/parity/bits correct or if
I need a special program to talk to this interface.

Can anyone help me out on this? It's a AEA CP-1 and I wish to interface it to a IBM compatable computer via the RS-232 port on the rear of the AEA CP-1. The cable is correct,
I use the same one for packet, and an external modem.

Thanks for any information,

Jeremy Cowgar - KB8LFA

Actually the DSP is the 15 Khz 4th IF of the radio. All of the modulation and demodulation is done in the DSP. So the signal reaches the DSP before detection, but is detected with in the DSP.

>Can anyone that has used a TM261 tell me what they think of the
>transceiver re pros and cons, as I am considering purchasing one.
>Thanks for the help. VE3CMN macneilc@magi.com

I've been using my new TM-261A every day for about a month now. So far, I like it, and I'm glad I bought it.

PRO:

- I like the menu system for setting up the seldom-changed functions.
- Lighted microphone keypad is handy for night-time use.
- Larger mic is easier to hold than previous Kenwood mics.
- Much more resistant to intermod than my old TM-241A was.
- The cost... AES has it for $269.95 (a great value for the money).
- Nice, big, easy-to-read frequency display, with all six digits the same size (on many rigs the first one or two digits are smaller).
- Easy to program memories, scanning, etc.
- Like all Kenwood mobiles, it's well-constructed (MIL spec).
- Has fewer "features" than the TM-241A, but still has all of the actually useful features you'd expect in a modern rig.

CON:

- Appears not to be quite as sensitive as the TM-241A was, but that may actually be a blessing in disguise. Don't get me wrong, there is not a big difference in sensitivity, just barely noticeable.
- Tone decode board is expensive (about $60). You may not need this, so this may not be a "con" for you.
- Sensitivity on aviation band is horrible (but it was on my last two Kenwood rigs as well). This may not be a problem for you.
- I don't care for the RJ-style mic connector, but so far, I haven't had any trouble with it, and other users of rigs with similar types of connectors haven't had trouble either. I guess it depends on how you treat your mic. I take good care of my equipment, and I haven't had to repair ANY mic connector in years.

Hope this helps!

3910. TS-50 Mod? Here's how!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-13 00:00:00 UTC
From: badger@telalink.net
Message-ID: <5dvtv7$iai@apple.telalink.net>
Source record: 183296

Awhile back I saw a couple requests for the mod for the Kenwood TS-50
HF radio for full coverage tx/rx. Here is a copy of a mod I posted in 1993.

Date: Wed, 24 Mar 1993 13:05:52 GMT
Lines: 38

copied from packet:
1783 1 19-Mar 2227 KA4RKT 14874_MTPASW MOD@USBBS ()
Sb: TX Coverage mod TS-50

Hi folks,

I just got a spanking new Kenwood TS-50S

Searching around the local LLBBS's I found a very simple mod for
full transmit from 1.7 - 30 mhz....

Remove the bottom cover of the TS-50

Locate the PLL board -- it is the pc board on top of the main board,
it has a shield on it's right side.

Locate the only non-surface mounted component on the PLL board --
look near the rear left-hand side of the pll board
(front of radio facing you) and remove the very
obvious diode. You can't miss, ther's only one.

Replace cover.

Perform microprocessor reset as described in your manual.

Please -- This mod for use only by persons authorized to use those
frequencies outside of the ham bands - such as MARS, CAP
and such. This radio is not type accepted for commercial
use outside of the ham bands....

>like the Realistic Pro-60?
>
>Is there anyother dualband radios that have as good a wideband receiver?
>
>Last of all, did anyone review this radio yet (ie. QST, etc)

I doubt a QST review would be adaquate...they usually go for the simple
stuff, and spend little time on things like out of band receive, etc.

Firmware bugs: There's a problem with two-way paging using the FTT-12
keypad in regards to sending back a voice response. I haven't really
played much with this, so I can't comment. Some people feel the filter
on WFM is too narrow (it is for broadcast FM, but fine for TV), but I'm
not sure if it's a bug or a feature...

Battery design...seems quite robust to me. If you want something
indestructable, buy a Motorola HT-220...if you want features, buy an
FT-50 and be reasonably careful with it (mine has survived pretty
dangerous drops).

Wideband Rx is excellent, usable from about 110MHz to 180MHz, 400-500MHz,
and full 800 (after mods). Sensitivity is excellent.

Features are great, my only gripe is the lack of a real priority mode
during scan (scan speed is excellent).

Software and cable are an accessory (about $40 for the bundle), and it
does plug into the speaker-mic jack. This ability to program via PC was
a key selling point for me.

Do a WWW search for yaesu, there are some excellent personal web pages
dedicated to this fine radio.

Also, I understand that the notch filter is outside of the AGC loop, so
a strong carrier can be silenced, but you will still see it on the
S-meter and it will affect reception of the desired signal.

With the preamp off, where is the base line?

If you are really seeing band noise (amplified by the preamp) and not
internally generated garbage, then why is the scope useless? There's
nothing under the high background noise level you will be able to hear
anyway. Doesn't matter whether the preamp is on or not. It's just
showing your eyes what your ears won't be able to hear ....

Hi all

I have two question for FT50R users

1. How is your FM Broadcast reception? I try it with my FT50R and I am getting a lot of static mixed with the broadcast (S8-S9 signal and rig is in W-FM demodulation mode.)

2. DTMF Decoder. When I set my rig to decode DTMF tones I could not see any digits on the LCD panel.
I am using my FT23 to send the DTMF codes. (FT50R User manual page 44) I am not using FTT-12 do I need it for this operation.

Thanks and 73s

3930. ICOM 2000 schematic?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-13 00:00:00 UTC
From: fiz <fiz@lamar.colostate.edu>
Message-ID: <3303DDED.4FF1@lamar.colostate.edu>
Source record: 183316

Hi,

I've recently fried my IC2000. Everything works, except it doesn't transmit when I push the PTT. The freq can be changed (not from the mike), receive is OK, etc. I hooked up a 6 volt power supply between pin 1 (+8v) and pin 7 (GND) on the mike, and it then transmits. I've obviously blown the 8v supply going to the mike. I'm sure its in the radio and not the mike since I was playing with packet when the radio quit, the 8v line is dead, and it works ok when I give it 6v (didn't have an 8v supply handy). I thought I had a schematic at one time but can't find it in my well organized shack :(

So, does anyone have a schematic for an IC2000?

> The HTX-212 will not X-mit out of band, with the exception of MARS/CAP.
> Why do you need to X-mit out of band anyway?

The marine band is in the 160+ MHz range, while 2m is in the 146MHz range. Unfortunately most transmitters can't over this wide of range unless they are specially built. Most ham transcievers aren't in this catagory (in fact I don't know of any that might be). To span this range you are talking about tuning over+10% in frequency. This isn't easy with high Q output stages.

I won't get into receive problems, but with 10.7 MHz IF's iimmaaggeess come to mind as being especially troublesome.

As always, your mileage will vary.

The cheaper solution is to buy another radio, IMHO.

A Yaesu FT-2500 will easily do this. The mod is in the Artsci books- you just cut a green wire. I've used this rig on the marine bands with no problem. Also have done the same with a Yaesu FT10 HT.

You neet to buy or make a "folded dipole" for the stereo. You can buy
one for a few dollars at a Radio Shack store, or make one from 300 ohm
twin lead (used for TV's). The antenna part is 31 inches long (I think)
and the feed line part can be any length.

In a previous article, eudani@jorsm.com (Ed) says:

Jerry, you need special software to decode the information presented
to the serial port of your CP-1. Unlike the PK-232 or KAM, the CP-1
only demodulates the baudot into digital 1's and 0's. You need a
program to decode those 1's and 0's into ascii that your screen will
display. The only PC based software I have found worth a darn is
CompRtty by Dave Rice KC2HO. His vitals follow:

Subject: FCC Proposal for Per-Minute Access Charges
From: UserName@net1.net (Full Name)
Date: Thu, 13 Feb 1997 03:13:23 GMT

TO: All Usenet Users

Your local phone company has filed a proposal with the FCC to impose
additional per-minute charges for you internet service, regardless of
who your internet access provider is. Your local phone company
contends that your usage "has or will" hinder the operation of the
telephone network.

Please e-mail your comments on this proposal to the FCC by Feb. 13,
1997. Send your comments to access@fcc.gov

You must include the following information or the FCC will not accept
your comment:

Docket number in the subject line..... its( CC Docket No. 96-262)
Your full name and Postal Service mailing address in the submission.

For more info, check out the FCC Web Page @ www.fcc.gov and look under
Access Charge Reform.

Help us out Please. E-mail this to your friends and remember, the
deadline is Thursday, February 13, 1997. Send you comments to the FCC
ASAP!!!! Protect your rights!

Thanks.

>

Not a whole lot - mainly updated firmware that lets the
XL do a few things that the 45 can't, like an "odometer."
IMO, the difference isn't all that great. The RF section
is the same. Personally, I'm waiting for the arrival of
the Garmin 12XL to replace my 45. Details at
sci.geo.satellite-nav.

Source record: 183357

Sorry Bob, the G-12XL far exceeds the performance of the trusted G-45XL. The 12XL is a 12ch parallel receiver vs the G-45XL single channel multiplexed. And you get twice as many waypoints. And proximity waypoints. It uses a MCX connector for an external antenna, thus is shorter than a G-45XL. And it has gone for as low as $225 at the LA boat show. Average street price is about $250.00 The G-45XL is now an antique.

Hello!

I am new to Ham and I want to get started with a basic base radio or mobile that can be converted to a base with a power converter. I have budgeted about $350-400 for my first radio. I will use a dipole wire antenna also. Can you make any suggestions for a first radio in that price range? I am studying for my license and expect to pass the test shortly. Thanks for any advice you can pass my way.

> Price is approx $260 at its lowest.

Sounds very interesting but a couple of questions remain:

1: How many conversions? The double conversion BC200XLT was FULL of birdies
and had that damned 21.7 MHz false image all over it's coverage. Anything
less than Quad-Conversion is not state of the art.

2: Does it finally have full 500 kHz to 1300 MHz coverage? Or does it skip
important bands as the BC200XLT did,(216-407 MHz for one big example, in
which is the 1.3 Meter ham band and a number of other interesting bands).

3: Did they finally add a lithium or NiCad memory-rentention battery or
does it still use a stupid little inadaquate electrolytic capacitor to
supply the power for memory-retention, like they did in the BC200XLT?

4: Did they have the wisdom to add an S-Meter to their LCD yet? Until they do, a scanner is useless for T-hunting. Ones that do have it are better for t-hunting than an HT is because of the wider coverage a scanner has as well as the fact that using your scanner to t-hunt free's up your HT for transceiving with people about your t-hunt progress.

All of the above are long overdue features in Uniden and Uniden-based scanners AND the technology for all of the above has been around since the early 1980's, so they can't say "it wasn't invented yet" even in reference to the BC200XLT which just was released on the market about that time.

As for item 4, I wish that the "S-Unit" had never been invented. Received RF field strength is supposed to be measured in peak microwatts or peak microvolts, not some mythical "S-Unit" for which there has never been a globally recognized standard definition. But that is yet another item on my wish-list of things that radio manufactures seem to be clueless about.

```

Oops! I almost forgot!

5: Does it have a BFO for receiving SSB?

Yet another item overdue yet simple to add during the design stage of the R & D. Overdue because all of the commonly used ham bands each have had ssb activity for at least 2 decades.

What radio manufacturers need is to require that everyone in their R & D department be licensed hams in addition to their other qualifications!

Hi Scott

I just got a new 840 y'day. I found that reception in the CW mode was
even more pleasing than that in SSB mode. Nope that's not a solution
to a problem that shouldn't exist in the first place... but it does
beat the hell out of using AM mode. If you're intending to TX on
AM, obviously this is NOT an answer.

Oh well...

3968. FT50R Great Radio?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-13 00:00:00 UTC
From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <5dvfk1$407@coranto.ucs.mun.ca>
Source record: 183375

I hear the Yaesu FT50R is a great dualband radio but I have a few questions.

What's problems or bugs does this radio have? I heard of some Wide FM
and battery button design flaw. Can someone tell me more of this and
any more problems this radio may have?

Does the computer cable come with the radio or with the software?
Where does the cable connect on the radio (ear/mic jack)?

Any firmware bugs?

How sensitive is the wideband receiver? Does it match a good scanner
like the Realistic Pro-60?

Is there anyother dualband radios that have as good a wideband receiver?

Last of all, did anyone review this radio yet (ie. QST, etc)

From: ka2qep@webspan.net
Message-ID: <5dviv6$kp9@news.webspan.net>
Source record: 183377

Hello, I am looking for a Motorola UHF Duplexer to buy. I am currently using one from a friend. We do not know what model it is, so it is a problem trying to get another. It was originally used at 462MHZ with a 5 meg split. It seems to work fine on the UHF 440 -450 Band with a five meg split. The duplexer consists of 2 square, rectangular, cavities with a slot on each one to adjust the reject frequency. The shell is made of silver plated copper and has a pass screwdriver adjuster on the end. There is a interconnect cable which is permanently secured between the cavities. If anyone knows what model this is and, or has one for sale, please let me know. Also I was told that there is a four cavity model which will work also.

Thanks and 73, Bill DiCarlo

Hello, I am looking for a Motorola UHF Duplexer to buy. I am currently using one from a friend. We do not know what model it is, so it is a problem trying to get another. It was originally used at 462MHZ with a 5 meg split. It seems to work fine on the UHF 440 -450 Band with a five meg split. The duplexer consists of 2 square, rectangular, cavities with a slot on each one to adjust the reject frequency. The shell is made of silver plated copper and has a pass screwdriver adjuster on the end. There is a interconnect cable which is permanently secured between the cavities. If anyone knows what model this is and, or has one for sale, please let me know. Also I was told that there is a four cavity model which will work also.

Thanks and 73, Bill DiCarlo

Sounds like you're off frequency. Make sure the repeater offset is set correctly. If that's not it, check the output frequency with a counter. RS sells one, so they should be able to check it out right in the store using their demo counter. Best of luck.

Gary,

Nice to see you here OM! I don't know if you are speaking "officially"
for ICOM (if you are Hell just froze), but the IC22U was a rig fom the
early 1980's (I'm pretty sure that you meant to type 1983). The original
IC22S didn't even come out until 1977.

If you can ever dig up an IC-22U schematic, I'd still like to have it.

Thanks es 73!

>IC-2350H and IC-2710H have attenuators built in on the squelch knobs.
>Although hardly a good solution, but it does reduce the problem when
>use (turn pass 12 o'clock)

From personal experience and even a salesman for a amteur dealer admitted that the IC2000 is not very good at rejecting intermod. It is better than some of the worst, I have found it to be only a slight improvement over the Kenwood 741. However its out of band recieve is better. Some say that the Standard 5718 is one of the better at rejecting intermod, I have no personal experience.

3982. IC-756 Poor Performance

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-13 00:00:00 UTC
From: Brad Thomas <bgt@thomascomm.com>
Message-ID: <33037144.1853@thomascomm.com>
Source record: 183389

I had the good fortune of evaluating a new Icom IC-756 rig and noticed a quark that I thought you might find interesting.

With the pre-amp on, the background noise on the bands (20M) causes the spectrum scope base line to be situated at a signal level around S6 when the first really useful signal that appears will be about S7. This makes the spectrum scope useless in every day operation.

Brad

Source record: 183195

Hi Bob:
I like mine. I had two for a while, but got rid of the base unit, as the fan was very very noisy!!!!! On two meters in FM mode, it does have IM overload, which means to you the squelch may pop from time to time, but as a mobile with 10 watts, it is acceptable. For 2 meter SSB at home I like the radio, and pull it inside for SSB contesting. It does a great job on 6 meters, a band I kinda like. On 40 meters SSB and CW it also works well. I think they did a good job on it, but just wish the fan was quieter. Oh.... BTW, don't buy the 250Hz filter for CW, buy the 500Hz. The combination of the 250 Hz and the fan is intolerable.
Best 73 Frank

Hello to all, I am selling a Kenwood TS-450 with built in antenna tuner. This rig belonged to a friend of mine who is now a silent key. This Radio is in absolutely MINT MINT condition!!! The radio has no more than 5 hours of use on it. This radio was brought new for $1250. I also found in a kenwood box with a voice module in it. I think it goes with this radio. I have to check. If it is for this radio it goes with the radio.
We are asking $900 obo.
If anyone is interested please e-mail me direct at:
mrusso@hoflink.com

Thanks, Mark N2FLF

From: Larry Gibbs <larrygibbs@ibm.net>
Message-ID: <33052BA8.1AC1@ibm.net>
Source record: 183207

My Yaesu 5200 needs to have the deviation cranked up on both 2 meters and 440. However, the 47K pots are little square buggers with a tiny hole in the top. There is no slot with which to use a standard tool.

Apparently, there is a special tool (maybe a toothpick) which fits into the hole (round) and somehow grips the sides. Has anyone encountered such a creature?

A friend who services avionics equipment says his pots all have slots. Any ideas?

In this price range you will be looking at a late 1960's though mid 1990's radio. From the 1960's to the earily 1970's, these were primarly tube rigs such as the Heathkit HW101, SB101, Drake. Starting in the late 1960's and earily 1970's, the rigs switch to hybrid, 1 driver and 2 finals for tubes, all solid state for the rest. Examples are the Kenwood TS-520, Yaesu FT-101. In the earily 1980's all solid state radios finally came out. In this price range will be low end rigs, i.e. Kenwood TS-130. If possible, see if you can get a newer rig because the receiver will be more senitive, but a older rig with a complete set of filters is a better buy than a newer rig with only a 2.5KHz phone filter. Also a newer rig will have 30m, 17m and 12m bands, the older rigs will not, but this should not be a big issue.

Congradulations!!

73's D. Pat Breeden WB3KUM/9

Because CW privileges already exist throughout all the amatuer bands;
i.e. you can use CW any where in any amaturer band. Only other modes are
restricted to portions of the bands.

I have an old Mini-Circuits mixer stamped MCL SBL-1 and right
below that is printed -10. I believe the device is a level 7
mixer but I'm thrown by the -10 that is printed on top.
Could this be a special mixer for a -10 dBm LO?? Any help
would be appreciated.

```
___________
| MCL SBL-1 | <-- Stamped in the metal can itself
| -10 | <-- Printed with ink

This radio will need new channel elements and probably new PL reeds. You will also need to retune and possibly replace components to move the radio into the proper band segment. You will definately need a service manual. Motorola's parts division can be reached at 800/422-4210.

You may want to consider getting local help from someone experienced in these matters or take it into Motorola service facility and have them do it. These changes are not a good first radio project.

4011. Kenwood TS-430S: long-jumper RTX !

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-14 00:00:00 UTC
From: max-l@usa.NET
Message-ID: <19970215230933.11642.qmail@mx01.netaddress.usa.net>
Source record: 183219

Hi,
a little problem to propose about a Kenwood TS-430S:
some time ago, suddenly, it started to show a problem I never heard.
While RTX is working, receiving or transmitting, it jumps suddenly on
a different frequency.
All functions are perfectly working after and before the jump and
there is no connection among frequencies on wich he jumps.
Temperature
conditions aren't also connected to the problem. It's quite random in
all cases.
Another typical show is a black-out frequency & S-meter panel with a
long beep. In that case all functions are locked. A little hand blow
on chassis resolve the problem.
I sincerely don't know the cause of this problem. It seems to be all
and nothing...!
Can anyone help me ? More, it is difficult to test RTX while it
jumps.
Maybe this is a problem happened to other 430s and solutions could be
simple to achieve.
Thanks to all will help me.

4013. SWAP FOR TUBE TESTER -- COMPUTER EQUIP.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-14 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu
Message-ID: <5e1ll8$fr5@csu-b.csuohio.edu>
Source record: 183221

If you have a mutual conductance tube tester such a Hickok, Triplett, B&K, Precision, RCA, Military Unit, etc. that you wish to swap for my Panasonic KX-P1595 Multi-Mode Office Duty printer, let's communicate. Or I'll consider ALL offers to buy my Panasonic outright.

YOU MIGHT NOT REALIZE THAT YOU COULD USE IT, PLEASE READ ON!

Many folks think dot matrix is passe, but not so. The reasoning follows:

WHY BUY A WIDE CARRIAGE COMMERICAL QUALITY OFFICE PRINTER ANYWAYS???

(I use a simple printer switch box between my laser and dot martix to save $)

* CHEAPEST TYPE OF PRINTER TO OPERATE for draft printing compared to wasting your expensive laser or inkjet cartridge on drafts. Use them for the final copy only. Ribbons are $2.89 each in boxes of six!!! Call MEI/Micro Center 1-800-634-3478 and you'll see.

* BE ENVIRONMENTALLY CONSCIOUS. Use any paper you want for drafts. Recycle regular or the 15 inch wide carriage computer printouts from the office, just print on the reverse blank side. You can also feed the printer recycled cut-sheet paper as well. Great savings on paper costs if you print alot and hate reading stuff off your screen.

* Dot Matrix is great if you or your kids are using your modem with, for example, the library to download cites, articles, etc. for school or hobbies. With a laser you can't print a line at a time, you must print the whole page, but the dot matrix economically does your cites a line at a time.

* Businesses still use them for cost savings reasons and to print multi-part forms and for inexpensive dot-matrix mail labels. The approximately equivalent current wide carriage model, the Panasonic KX-P3626, sells for $420 in the 1997 Office Max Catalog and has a list price of $520.

* Dot-matrix printers can print a page from a web site on-line a lot quicker than a laser many times. The reason is that you must wait for the laser to process the entire

page, whereas the dot matrix prints it out line by line. I have 2 MB of ram on my NEC 95f Office Duty Laser and have found this to be true. Of course no dot matrix will yield the print quality of a laser, but one makes compromises, if it's only for one's own reference.

* Durability, the high quality office wide carriage units generally don't break, they just keep on ticking!

* The wide carriage is great for printing many-column spread sheets (businesses use them for this too)

OKAY Here's the Panasonic's Specs:

- Works with Windows 3.1 or Windows 95 - You select driver from Windows
- 15 inch wide carriage
- 9 Pin Dot Matrix
- Weight = about 35 lbs.
- Friction or tractor feed of any width paper up to 15 inches.
- Form Length: 3 inches to 12 inches via a form length dial or via your software
- Pitches Built In: 10, 12, 15, 17 per inch and Proportional Spacing
- Fonts: Draft, Bold PS, Courier
- Controls: On Line
Form Feed
Line Feed
- Pararell Printer Port:
- Has Optional Serial Port:
- Rear Paper Bail:
- Single Sheet Feeder:

Good cond. TO SAVE ON YOUR SHIPPPING COSTS, I'll pack it and bring it DIRECTLY to a U.P.S. terminal, thus shipping it via "the least expensive way". As you may be aware if you bring it to Mail Boxes, Etc., the total shipping costs using U.P.S. can be more than double the total shipping bill if you packed it and brought the package to the U.P.S. terminal yourself. Mail Boxes, Etc. marks up the U.P.S. fees and obviously must charge for packaging too.

If interested, please email me at:

l.mclaughlin@popmail.csuohio.edu

Thank you.

>--
>Tom Watson
>tsw@3do.com (Home: tsw@johana.com)

What do you mean you don't know of any radios tha can go from 2m to
the marine band??? Most of the new Kenwood HTs can, such as the
th-22, th078, and for that matter the alinco 2m ht's can just by
snipping a wire.

Look people. I asked for help! I would like to modify a ham rig for
use on the marine band for emergency use so I don't have to waste a

bunch of money on a MARINE rig I'll never use. I am sick and tired of all the unsolicited e-mails from cranky old men who have nothing better to do than to tell me this is illegal (which it is not).

If you cannot offer me the help I ask for but would rather treat me like an unintelligent fool than KEEP YOUR FUCKING MOUTHS SHUT.

Oh...I guess I'll get hate mail for that...

Whatever...I give up on getting help from ham operators...you are all a bunch of turn-of-the-century jack-asses who cannot handle progress and new technology.

From on generation X-er, I can't wait 'till you all die.

There are a bunch of differences, but the major one is that the FT-51R
has two independent receivers that can operate at the same time. The
FT-50 has only one.

: Bill

Well that may be where you are mistaken, a friend of mine (salesman at a local store) has informed me that there will be no more extended warrantees issued on 19-series products. It seems as there are too many "abuses" and the fact that the warrantees aren't intended for commercial use (such as with the GMRS and business band radios that Tandy proffers).

He told me that existing TSP's will be honored until the last of them runs out which would be 5 years from the date of the memo issued stopping any further sale of the add-on warranties with 19 series products. The option isn't even available on the POS terminals anymore.

Later and 73,
Joe

The keying in of names and addresses, at least in the Cincinatti District,
is still a sticking point with most District managers and therefore just
about every manager from Regional on down to the store level. The
employees are still required to maintain a 90% rating in the Louisville
District at my last recollection.

```

So how about some news? That's the way it's been for as long as the Shack has been in business. How many years have we been telling them to stop asking for our phone numbers? Yet they still do it. And now they've upgraded to where they no longer ask for your phone number, they just ask for your name and address, that way you don't feel like a number anymore. Anyway you look at it, Tandy Corp. has been deaf since the signing of their articles of incorporation. I am personally glad aI no longer work for them and would never care to rejoin their ranks. Lets face it, the shack is a great place to buy parts locally, but anything else, well, I guess I'll give in on the 202 being a good starter rig, but it is one of their very few successes in the world of Ham Radio.

Why don't you print or save this info in case you need it in the future?

Hello Friends,
It's time to take full advantage of the online medium by having your photographs scanned today! Once your pictures are scanned into one of three formats (GIF, JPEG, or BMP) you can do many exciting things with them.

-You'll easily be able to attach them to emails and send them to people your chatting with online. No more having to try and explain what you look like!

-You can also use your photos in all kinds of fun projects: build web pages; design your own greeting cards; make personalized stationary,desktops, and screen savers- the list is endless!

- Scan pictures of yourself, your pet, your vacation, or whatever you choose!

Cyber Services will scan ANY photograph, drawing, magazine clipping, or other artwork to an image file, and email or US mail it (on disk) back to you within 24 hours of its receipt. (You must be able to receive file attachments to get your file(s) via email. Check with your ISP if your not sure.) PRIVACY & CONFIDENTIALITY ARE ASSURED. You'll also receive helpful technical tips on everything from renaming your file to saving time when sending it to people via email.

We scan all our images in 16.7 million colors for best quality. For just $1 extra we can enlarge or crop your photo, blur out a body part, or ad text (such as your name or email address).

Best of all, as a FREE GIFT to you (limited time only), IF YOU CHOOSE TO, we'll reserve you a FREE PAGE (or pages) in our "Internet Date-Site" (Now under construction!!!). This web site contains pages classified by local area and sexual preference. There's also a erotic image gallery (must be legal age to enter), and a "special interests" section. That's right, you can have your own page on the internet for just $4! (Note: You're responsible for answering your dog's email!) Your free page(s) will include any or all of the following: Your scanned photo(s) (You pick which ones- You can have some, none or all of your photos posted on your page), your email address with an icon visitors can click to send you mail, and a brief profile about you. We'll remove or modify your page, at your request, at anytime! When the "Date-Site" opens for business, you'll receive an email notifying you of the address of your personal web page. You can give the address to people and they can view it from any internet
connection! There are millions and millions of people on the internet.It's

time you start meeting them! (This service won't be free for long so act now!)

If you have any questions regarding our services, please call us at (541)744-5718.

Ordering Information:

Price: $4 for first scan, $3 for each additional scan
Extras: $1 each to add personalized information. (name/email)
$1 each to have image modified (enlarged, body part blurred, etc..)
$2 to have image files mailed to you on a floppy disk (IBM or MAC).
$1 credit card processing fee (Visa/Mastercard users only)

If you would like your photographs returned to you please include a self addressed stamped envelope. Otherwise they will be destroyed.

Order Form (PRINT OUT or COPY CLEARLY):

Name (optional):

Email Address or Screen name (PRINT CLEARLY! You must be able to receive file attachments. Otherwise include $2 for shipment on floppy disk.):

Address (optional unless having shipped on disk):

Phone number (optional):

File type (GIF, JPEG, or BMP. GIF recommended):

Extras (Exact personalized info you want printed on scan):

Disk Format (if having mailed on a floppy): IBM or MAC

Payment method (Cash, Check, Money Order, or Visa/Mastercard):
Please make checks payable to Cyber Services.

Credit Card # (credit card orders only):

Expiration date:
Don't forget to include the $1 processing fee if your paying with your credit card.

Do you want the FREE GIFT? Yes or No (circle one)
-Web Page(s) in our "Internet Date-Site" (under construction). You can have a page for yourself, a page for your car, and a page for your cat! Be sure to indicate where you want your page (F4M, M4F, F4F, F4M, or Couples) and which of the following info you want on your page (print clearly): State and Town, email address, year or birth, physical description, quote/message (under 30 words please). Please indicate which photos you want on your page (if any) if you don't want them all to be displayed. If your want your nude/erotic photos displayed in our erotic image gallery YOU MUST include a signed statement that your are over 18 years of age or older and give us

consent to display your nude/erotic photo, and be sure to tell us if your want it displayed with your info or anonymously.

Mail the above information and photos with payment to:

Cyber Services
2852 Willamette St. #131
Department 1
Eugene, OR 97405

Orders sent overnight will be given first priority.

Erotic/Nude photo's will be accepted providing everyone in them is of legal age.

Questions? Call (541)744-5718

Please help our small business grow by sharing this info with someone you think could use it.

Thank You!

4024. ALINCO DX71 INFO !!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-14 00:00:00 UTC
From: hershman <hershman@ix.netcom.com>
Message-ID: <33046098.276A@ix.netcom.com>
Source record: 183251

ALINCO USA has sent me an E-MAIL saying there is no DX-71 or anything like it to be announced in 1997. I can't tell if they are telling the truth. I know at my company that we are always told to deny the existance of a new model to the customers. This is to keep the current older model selling off the shelves before the new model is in production. I still find it interesting that a UK DEALER would have an advertisement for his radios and at the Bottom of the AD say "COMING IN JUN 1997 ALINCO DX-71 ! ". Why would the Dealer do this? Perhaps the local Alinco Salesman tipped off the Dealer as to a new model coming in the near future! I was going to purchase a Alinco DX-70TH for mobile, but have decided to waituntil JUNE/JULY 1997 to see if this new model is announced. I can wait that long.
CHEERS, STEVE NS1R

it to be announced in the current year (1997). I

Source record: 183253

Hello,

I am selling the a Realistic HTX-404.

It's in PERFECT condtion.... Comes with unit and battery + Antenna of course!

It has no Manuals. This is because it was given to me by a friend who had no interestes in Ham Radio. So, he didn't keep any manuals or box for the unit.

I am selling it for $115.00 + Shipping. If you look into the latest Radio Shack
store they are asking $199.99 for them now.. so, its a great deal!

If interested please contact me...

Thanks N9MXT - Jeffrey

4029. Alinco DJ180T mod for MARS/CAP use

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-14 00:00:00 UTC
From: pruth@alpha.cc.oberlin.edu
Message-ID: <5e1uaq$7o3@news.cc.oberlin.edu>
Source record: 183256

Here is the mod passed along to me for posting.
This is for the benefit of those engaged in
authorized MARS/CAP activities on authorized
MARS/CAP frequencies; otherwise transmitting
outside the ham bands is illegal, immoral,
unethical, unjustified, unnecessary and just
plain stupid.

"I bought a dj 180t handheld and alinco sed
it cudn't be modified. If you know anyone who
owns one here is the mod. I pass it on just
because I had such a hard time finding it myself.
DJ 180T mod:
Remove battery pak.
on bottom of radio is a silver plate with
4 small screws, remove them.
carefully lift the plate off(several wires
attached) and move it to one side, being aware of
the button that releases the battery, and how it is posistioned.
On the same side as battery release
button (inside the radio) you will see a red
wire that comes up and makes a loop.
Cut the red (only one there) wire,
sealing off the ends for safty.
Reassemble the rig and reset the CPU
by holding "function AND LAMP" buttons while
turning the rig on. Just holding the function
button will reset the cpu but must also hold
the "lamp" button to enable the extended tx.
TX is now 130-173.995. Be careful as I will not
be held responsible for messing up the rig.

Buddy
KR4KJ
tjwood@va.tds.net"

WARNING: Transmitting outside the ham bands,
other than for MARS/CAP, is illegal, immoral,
unethical, unjustified, unnecessary and just
plain stupid.

Phase noise? What? ALL the units for sale in the US right now have
broadband noise generated around the signal (6khz) on transmit?
A "Mod Kit"? And one which you cannot install yourself?...
You get this radio and then have to send it back to ICOM for an
un-determined amount of time (being they are going to have to fix all
the rigs)

Thats a significant piece of information.

Can we get any ferther info on this?

Thanks
Bob

4036. Improving the SONY SW100E performance ?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-14 00:00:00 UTC
From: greg@uea.ac.uk
Message-ID: <greg-1402971427340001@gni.mgt.uea.ac.uk>
Source record: 183263
Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave

I have just purchased a SONY SW100E and I was interested in what I can do to improve the performance.

I have some specific questions:

Reception
1. SONY sell active antennas for both indoor and outdoor (the AN-102 & AN-1) use are these significantly better than the random wire included ?
2. If I wanted to get two antennas (active or passive), one for indoor use and one for outdoor mounting, are there any recommendations, bearing in mind I have only a very small back garden ?
3. Do I need multiple antennas for covering the frequency spectrum up to 30 Mhz ?

Sound
4. The built in speaker is fine for travelling, but I want to have better sound quality on my desk at home can anybody recommend some externally powered speakers ?

5. Are there any other additional bits of kit I should consider to improve the reception & sound quality ?

Thanks, Greg Newton-Ingham

From: phelbert@rica.NET
Message-ID: <19970214142422312.AAA387@phelbert>
Source record: 183267

The Ten Tec T-kit 1220 is an excellant mobile or base 2 meter FM rig. I built one last February (with the 30 watt amp kit) and have had no trouble with it. The manual is far better than the old standard, Heathkit, in that more than 50 pages discuss theory of operation, servicing, etc. (Heath would have just touched on it in a page or two.) The rig went together in about a week's worth of spare time including a couple of real late nights and all weekend. Assemble logically follows function, and testing of each section helps build confidence.

Operation (including programming) is very user friendly. All functions can be learned in a few munites whereafter the manual can be put away for future reference. The op amp boosting the CTCSS tones in my rig had a bit too much gain causing the tones to pick at my audio. I increased the value of the output resister from this stage to get proper deviation of the tones. Audio reports are excellant. Received audio is also excellant. The rig is less effected by intermod in high rf environments than my Alinco HT or my Regency HR-2a/b.

Several other hams have built this rig after hearing mine. They are as pleased with the results as am I. As always, Ten Tec is standing by with by far the best product support in the industry. You probably won't need to call them, but if you ever do, you'll come to understand the near fanatic loyalty common to Ten Tec users.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are

suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s are use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier

activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal
Signal in University Park, IL, phone (800)524-3021. You
can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone
(800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Message-ID: <5e26nv$23h6@usenetp1.news.prodigy.com>
Source record: 183272

I have only had my radio for a couple weeks. The cloning cable plugs into the speaker/mike jack on the radio. It takes two cables. Think the short cable came with the software. The longer cable is the one used on the FT-51. Loading the info from the PC is slick. It takes less than a minute to load all memories and options. I have call the software people twice with questions. They were very helpful. I don't like the SMA Antenna connector and the antenna that comes with is useless. I am using the Icom 270 and its better than the original. Get on the Yeasu web page to read about all the FT-50 problems and modifications. Dave KB0OCI

4046. FT50 and Adms-1C software

Is there any way I can enter frequencies between 200 & 300 Mhz? The adms software will not let me , but I can manually enter them through the key pad and save them to memory.

Jim

It's nothing more than a fancy name for a group of people that are operating wherever they want, without a license from the FCC (or any other governing body). This group originally began operating above the government authorized original 23 channels of CB. As CB expanded to 40 channels they would operate between channels, and finally branched out into the area between channel 40 and the bottom end of the 10M Ham Band. Their poor equipment, high power, and/or improper use of same caused the FCC to ban the manufacturers from selling amps to Hams that included 10M. You can now find examples of this illegal operation all over the spectrum (including the Ham bands). Just give a listen to all the SSB activity in the lower end of 10M (daily), 40M almost every morning around 7002, 30M (all over), and the bottom end of 80M (almost every evening). In summary, there should be a bounty on them!

Subject: YAESU FT-3000 MOD PROBLEMS

HELLO,
I am in need of some answers. I have a yaesu ft-3000m. I have seen
that the mod for it is to cut the green wire near the speaker, then
reset the c.p.u. Well, It did not work. It has not changed the tx/rx or
nothing. I was wondering if ANYONE might know of a different mod? And
why this mod is not working? Others have told me that it does work, but
I dont know for sure, but I do know that it is NOT working on my radio.
Is there another mod for this radio, or could it be a different mod for
a later model? PLEASE HELP AND LET ME KNOW. YOu can e-mail me direct at PZVU87A@PRODIGY.COM
thanks so much!!!

4051. Source for test equipment needed

I was hoping somebody could direct me to a source of new test equipment
thats reliable and well priced. It could be a retailer in the NYC/LI area
(I know Radio Shack, of course, but I'm looking for something else) or any
kind of mail order is great.
For example, maybe I could use a DMM with good features and reliability,
but I don't need one I can run over with a payloader or submerge in battery
acid that costs $400, if you see what I mean.

TIA
George

Yaesu have a new HF Radio!
The FT920, It looks like an FT1000MP and is DSP plus 50MHz.
It has two VFO's (controls) which indicate it may be possible to monitor
2 bands if a second bandpass filter is installed like the FT1000...
that is not known yet.
You can view the radio at:

The funny thing is, his radio can't be modified. Never could.
The one good thing about the 212 is the narrow filtering. So
he never got the answer he wanted because that wasn't the answer!

It is not clear to me exactly what antennas you have connected Ed. But, I believe that there must be a separate connector for FM sigs and for AM sigs. The AM sigs could be received via an internal loop or rod antenna. The two-prong connector that you mentioned is most likely for FM sigs. You can try a simple rabbit ear ant there for test purposes or even just a simple dipole antenna made of 300-ohm twin lead. To start with, just connect a short piece (e.g. two feet) of 300-ohn twin lead cable to the FM ant jack. Perhaps a trip to Radio Shack will allow you to visually see what a dipole for F-M reception actually looks like.

Good luck.

Don't confuse the excellent front end filtering of the HTX202
with the mediocre filtering of the HTX212. The latter *will* receive
out of band, and suffers the intermod which commonly accompanies
such a "feature" (I'm tempted to say "such a defect"). It will
also transmit out of band (MARS/CAP enabled), but not very far
out of band. The firmware won't let it operate on Marine channels
(where it would be illegal to use anyway since it isn't Type
Accepted for that service).

I'd like to add that it is important for amateurs to fight against
this sort of misuse of amateur equipment by people operating in
other services. We should all recall the uncomfortable restrictions
placed on amateur amplifiers due to misuse by members of the CB service.
We are likely to see similarly uncomfortable restrictions placed on
amateur VHF/UHF equipment if it continues to be misused by operators
in other services such as the public safety, land mobile, or marine
services.

I, for one, think you've done the ham community a
public service by condensing the ARRL petition and
providing it here (or anywhere, for that matter).

The question I have is why the petition doesn't
include expanded CW privileges as well as for
phone?

4068. Yaesu FT-51R vs FT-50R ?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-14 00:00:00 UTC
From: "Richard O. Kinkead" <richard-kinkead@worldnet.att.net>
Message-ID: <01bc1a1a$2eddf020$356492cf@crc3.concentric.net>
Source record: 183331

I am a new to the hobby, and will be purchasing my first
radio (an HT) in the near future. I am looking at the Kenwood TH-79A(D),
Alinco DJ-G5TH, Yaesu FT-51R, and Yeasu FT-50R. I am biased toward the
FT-51R and FT-50R, and although I have read the manufacturer's data on both
radios, I am still not sure which is better. I am concerned that vital info
is not in the literature.

1) Why is the 51R more expensive than the 50R? Is it a better radio?
2) Does the 51R have more functions or programming capabilities than
the 50R?

It seems as if the 50R is preferred by most users. What are the advantages
of the 50R over the 51R? Quality is my biggest concern.

I am awaiting a call sign. The next post will include it.

Thanks
Richard

My god. Were are you people coming up with this stuff? "Short out a
terminal on the back"? Give me a break.

This is how you access the programming;

power off.
hold ptt and lamp and power on.

simple as that. Do the same to return to normal operation.

I have used the radio for several weeks now and see the signals I am
listening too. The preamp raises the noise level, and the scope is
reporting that to you. Most any kind of scope connected right after
the preamplifiers will show the same thing.

Source record: 183340

I have one and really like it. I can hit all the repeaters that I can hit with 5 watts. Alittle scratchy in doors. I did the wide band mod. and us it as a monitor on 488 mhz for work, won't transmit there thou. You can't put a different antenna on it, but the folding antenna is very convenient. I have an FT-11 that has about the same size case, however the S41 seems alot smaller because of the folding antenna. I've had it for about a month and the AA batteries are still holding up.

The tone squelch on the FTT-12 is bad. It allows noise to open the squelch.

The technical bulletin TB-9640 is for ALL FT-50's with FTT-12, even if you bought the radio yesterday.

PROBLEM: DECODE OPENED WITH NOISE

YOU HAVE TO CHANGE 3 PARTS: R1001, R1002 AND C1004. You can send in your FTT-12 or order the parts at no charge.

This modification really works great, the ctcss does not open at all except for the proper PL code.

"With no problem"???? How do you you aren't causing problems?
I cannot begin to tell you the grief you cheapskates cause(d) with
your modified radios for those us of who work(ed) in maritime comms.
Suffice it to say that transmissions with radios that aren't type-accepted
are documented whenever possible* and forwarded on to the proper
authorities. Those authorities are sometimes like sleeping giants, but
when they awake you will feel their wrath!

Don't be so damn cheap, Sharples - go buy a VHF marine band radio. West
Marine sells an all-channel rig for around $120.

Jeff KH2PZ (former Coast Guard radio officer)

* USCG coastal stations monitor many channels at once - when your trans-
missions come over two channels at the same time it's easy to determine
some penny-pinching ham is using a modified HT. Hopefully he's not as
cheap in properly outfitting the rest of his boat.

Don,
There is a great book on radio direction finding.
It includes many do it yourself home projects.
It is called: ''Transmitter Hunting, Radio Direction Finding
Simplified" by Joseph D. Moell, K0ov, and
Thomas N. Curlee, WB6UZZ. It is a TAB Publication.
It is available through most Ham Radio outlets.
You can also order it by calling 1-800-822-8158.

The software has an intentional block to prevent 200-300MHz frequencies from being entered into memory....

SUPPOSEDLY, this is because the radio's oscillators would "go berserk" when receiving in this band....

I understand that these blocks (200-300MHz and cellular) are to keep the Feds happy...

4094. Sound Blaster = easy WEFAX FAX SSTV RTTY

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-15 00:00:00 UTC
From: "Brian E. Cauchi" <gcauchi@keyworld.net>
Message-ID: <01bc1b89$25fdf0c0$0101a8c0@gcauchi.keyworld.net>
Source record: 183108
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc, rec.radio.amateur.space

Hello... Brian here!

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version of my FTV software.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside this software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

Registration promotes the further development of this software and entitles the user to future upgrades paying only for delivery expenses, if any.

Finally, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

4097. FS: Yaesu FT-757GX Ham Radio Setup

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-15 00:00:00 UTC
From: "Michael S. Keller" <green@null.net>
Message-ID: <3306417F.32E7@null.net>
Source record: 183111
Cross-posted to: ok.marketplace,rec.radio.amateur.equipment

I have a Yaesu FT-757GX HF rig for sale. It has FM/AM/SSB/CW with a
built-in
keyer (full- or semi-automatic). It has a Yaesu FP-700 power supply with
built-in speaker (bigger than the 757's internal speaker). I have the
owner's
manual and the service manual. I also have Bencher BY-1 paddles (black
base
with chrome moving bits).

$650 or best reasonable offer for the package.

The rig runs nicely. The case has a few scratches near the back, but
nothing
that overpowers the primary brownish color. After I purchased it about
five
years ago I sent it to Yaesu for service because the FM section didn't
work
right. They fixed that and did a general tune-up.

Contact green@null.net

USED TUBES,UNTESTED BY US, SOLD "AS IS,WITHOUT WARRANTY",
These tubes were part of the estate of a long time radio
repairman,who was in business in the San Francisco area
from the 1930's to the 1970's.The tubes were bulk packaged
in large boxes marked "tested ok", however we have not
checked any of these tubes. We have been advised by one
of our customers that some of the tubes we shipped were
duds. These tubes have been priced accordingly.

****
* Shipping for the below tubes to anyplace in the USA: *

Message-ID: <3305F543.6E3C@airmail.net>
Source record: 183116

Howdy,

I recently wiped out on my rollerblades, and my TH-79 developed a serious case of road rash. The radio still works fine, but I need to buy a new front cover and sheet of rubber buttons. Is there a parts source for Kenwood? Or is a service center repair my only option?

Thanks,

-mark.

would there be any harmful effects to wiring D batteries up to the ft-11r's AA battery back? obviously higher Ah, but anything bad???

would there be any way to get the radio to tx more than 1.5W on this? (is that what it does with AA?)

Not if it's an Icom. They'll replace the 756 with a new model by then.
Ask me, I know. I own an IC-737. I bought a 706 last September, now
rumor has it that it's being replaced by a 708. No more Icoms for me.
I'm tired of having a radio's resale value plummet because it is
orphaned by Icom before the bugs are worked out. My next HF rig will be
a Ten-Tec.

That's kind of the way most electronic things are these days, aren't they? Ever buy a computer? Why should anyone expect one of these mostly surface mount and VLSI imported radio thingies to be any different.

Heck, most hams don't really buy radios any more anyway. They buy fancy displays, and lots of memories, and gripe because their HF radio won't receive 2.4 GHz in "dual receive" mode ....

But I like your conclusion -- buy Ten-Tec. They are radios first, and don't advertise themselves as computer peripherals :-)

(this is a copy of my response on this subject to jeffreyH, Busybody)
Well, aren't we self-righteous today! In any event, as it happens I do own a marine radio. It is not portable, and is attached to my large boat. Therefore, it is not suitable for use in a small boat of the sort I rented on my last vacation. The FT-11 was much more appropriate, and, when the engine conked out in my rental boat in the middle of Puget Sound, I was able to call for help! So sorry I didn't use a "type approved" radio- I suppose it would have been much better for my family and I to row the ten nautical miles or so to the coast. In addition, Jeffrey, you really don't have the slightest idea what you are talking about with respect to performance- I have a fully equipped radio communications shop including a Service Monitor and both a HP and Advantest spectrun analyzer and shielded room. I've looked at both of the radios with respect to deviation, spurs, and frequency stability- they are fully the equal of my Midland marine radio. In fact many of the ham rigs are based on commercial designs or vice versa- for example the IC02 and the essentially identical Aircraft HT's.
So go mind your own business Jeffrey.

4115. NEW TEN TEC OMNI 6 PLUS

Newsgroup: rec.radio.amateur.equipment

Message-ID: <33069E93.27EC@prodigy.net>
Source record: 183130

http://www.mtechnologies.com/mthome for ham software, kits, the CQC homepage, and more!

I've come by a supply of disposable anti-static wrist straps, which are a great (and safe) way to make sure that you are grounded when working with static-sensitive devices such as CMOS integrated circuits. Sure, you can run a clip lead from your wrist-watch or ear lobe to a convenient ground, and that will take care of static. But it will also route any high-current electricity that you happen to come in contact with, and is a bit like working with your bare feet on a wet floor. The SAFE way to do it, as with these straps, is to incorporate a current-limiting resistance so that static will be grounded off without an increased risk of electrocution.

While I've started including one at no charge with the Island Keyer kits, I've got more than I really know what to do with. So here's the deal--

Send me One Dollar ($1.00) and an SASE with 55 cents postage on it and I will send you FOUR wrist straps.

I'll also include some product literature since it won't increase the postage cost. Or if you are ordering something from Milestone Technologies via the web site (url below) or by phone just mention this to get any number of wrist straps at 4/$1 with no additional postage cost.

By the way, these are genuine 3M 2209's in original sealed packaging, and they are UL certified. They include the wrist strap, paper lead with embedded conductor and resistance, and copper foil tape to attach to a convenient ground.

Send your dollar and an SASE with 55 cents postage to:

Milestone Technologies
3140 S. Peoria St. Unit K-156
Aurora CO 80014-3155

PLEASE if you need more info e-mail me direct at aa0xi@mtechnologies.com rather than take up bandwidth in the newsgroup!

Man, I couldn't agree more! At least Ten Tec radios look like something I homebrewed up in my garage, and not like that crap that city slickers seem to like. And who needs all these "features"? Just give me something I can work on every once in a while (or send to Tennessee for repair). I am tired of the "finished look" of these slick radios (from the "big three") and the fact that they are constantly coming out with new products. I'll take a Ten-Tec any day, and at least it will hold its value. Ten-Tec has the decency to stick with the same design for years instead of making my radio obsolete through the "advancement of technology". I and plenty of my toothless buddies are HUGE Ten-Tec fans. Hell, they don't even advertise like those slicksters, who are probably just trying to pull the wool over the eyes of us po' country folk.

73"s" (meaning best regardeses, I guess)

Anybody ever owned one of these? I came across one at a ham sale, and picked it up reasonably. It must have power supply problems, because it won't power up. The previous owner stated he had connected a wire inside incorrectly to the front panel, one set of pins off. He didn't remember in which direction. Any idea what damage he may have caused? How much would this be worth in working condition? It's a model MSR-8000, general coverage transmit and receive from 1.6-30MHz, military-style, 125 watts out (according to the book). 73, Web- KR4WM

Who is going to test/use the equipment to get the bugs out? Who will report the bugs?

I have been in the computer business for more than thirty years. My employer takes products and puts them through a thorough test procedure prior to shipping them to Customers. Guess what? No matter how hard we try, we always miss something that the users find. If there are bugs, most manufacturers will update while the rig is in warranty.

Another stupid part of this idea is what happens to the stock if nobody buys the stuff? It sits in a warehouse untill it is sold! So you can wait 100 years and still get serial number 00007!

73,
Bob

Have a nice Kenwood TS-930/AT from an estate. Rig is in good shape
and has a CW filter. Don't have original box, but have manual and
hand mic (with the up/down buttons).

Being a "FT" man, I'm selling the Kenwood for "trading money". Bottom
dollar is $750 + shipping.

Message-ID: <5e4h7i$1hk6@info4.rus.uni-stuttgart.de>
Source record: 183151
Cross-posted to: rec.radio.amateur.equipment,uk.radio.amateur

Hello!

Recently I bought a Kenwood TH-79E (European version!!) handheld transceiver. It does NOT have the CTCSS-unit installed. By pressing [F], [TONE SEL] it is nevertheless possible to select other TONE frequencies than 1750 Hz. If I e.g. choose 123.0 Hz, press the TONE-button and then use PTT normally it is possible to use a nearby repeater that requests CTCSS-subtones. So, what is this CTCSS-unit good for?? Have other OMs noticed this? Why is the signal quality so low, while using the repeater (might be my poor antenna)?

Thank you very much. Greetings,

Marc
(elli@studbox.uni-stuttgart.de)

I hope everyone understands this is against FCC regulations. Amateur tranceivers are not TYPE ACCEPTED for this service. There are reasons for this. I take it no out of amateur band transmissions will be made until a bonfide life and death situation occurs.

You should not publically admit to federal offenses. You admissions are being permanently recorded in archives like DejaNews.

> marine band instead of buying another radio.

Have you looked on the QRZ Website? I've found quite a few mods there.

Now, as an answer to some of the complaints you're receiving about the pros and cons of amateur radios having the capability to transmit out of band-

I am a career firefighter. I work in a <paid> department, and do it for a living. I'm not some yahoo volunteer out to make a name for myself by doing stupid things. (Yeah right, like going into a burning building while others are coming out isn't stupid, but hey, somebody has to do it!) When I got my amateur license, it was then that I found out that certain ham radios could be modified to work out-of-band. At the time, our department was stiffed for funds, and occasionally, some of us would be inside a burning building with no way to communicate with the outside (lack of radios). It was a godsend that I obtained permission from our department's chief to use my amateur HT and mobile to transmit on the fire department frequencies! He understood the EMERGENCY nature of my use, and consented without me even having to use my cattle prod! I've also used my mobile rig when I was off-duty to call the F.D. Dispatcher and inform them of auto accidents that may have gone unreported for long periods of time. Or to let them know that no emergency response was necessary, saving the wear and tear on our engines. At $700 per run, it adds up. Yes, all things considered, it costs about $700 to put a fire truck in the street for EACH CALL! And since we run first-responder medical as well as fire calls, and ran over 5000 calls last year- well, you get the picture. I've only used my mobile to call in accidents four times in 5 years. It's not like I abuse it. I don't call the dispatcher to ask what time it is- it's ONLY FOR EMERGENCIES! If this fellow wants to use his radio in a like manner, WHO CARES!?!? Our department now has more radios, and I no longer must carry my HT into fires. It is my opinion that my use of my amateur HT/mobile on frequencies AUTHORIZED by my department probably saved time, money, and lives. How can you argue with success? 73, Web Williams, KR4WM, City of Myrtle Beach Fire Department, Myrtle Beach, SC

THe FCC, with all their people and funds is now searching the DejaNews
archives to find out who has admitted to federal offenses. They will
then go before an OJ Simpson kind of Grand Jury and get a warrrant for
arrest. The FCC will get a plane ticket and show up to your door and
confront you with your e-mail admission. They will search your house and
confiscate your radios and computers. So make sure not to admit to
violating out of band rules!

That response makes WAY too much sense for this newsgroup, which is normally filled with idiotic postings such as the one you're responding to.

Of course, the design of a radio, or any other piece of sophisticated equipment, must be tested. It is way too expensive for manufacturers of hardware to have extensive beta tests, a la software. Thus the first buyers will be the ones to learn if there are deficiencies. If you are extremely risk-averse (read: a sniveling weenie), don't buy it for a while.

As far as the '756 and this thread goes, the point is moot (or "mute" as most people would say). All of the so-called deficiencies of the '756 were planned. They are not "bugs".

<snip>

I have the 8500 and it operates in the same manner. I assume that the fan it thermally activated by heat build up in the heat sink. Mine has operated this way since I got it, about a year (year and a half?), and it still runs fine.

> Also, am I supposed to hear it? What ever happened to Silent Fans? I
> hear this when it is on low speed... a faint flutter sound.... is this
> normal?

When I had the radio in my car the fan (radio chassis mounted under drivers seat) was very audible on high speed. I was able to cure this problem by moving the radio. I took it out of my car and put it in my turbo diesel pickup. Don't hear a darn thing now!! ;-) (anybody got a deal on a amplified speaker? just kidding).

Anyway, hope this sheds some light (one or two candlepowers worth?) on your situation. I always welcome comments and corrections, but no flames please.

Stay safe, stay happy

Scott

4159. FT-50 and FT-530 in-ear or throat mic

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-15 00:00:00 UTC
From: zettel@libby.org
Message-ID: <3305f5d0.1815894283@jules-verne.libby.org>
Source record: 183175

Does anyone know of a source for a high-quality in-ear mic or throat (conduction) mic that can be adapted for use with an FT-50 and an FT-530? Actually, I'd prefer the whole magilla -- earspeakers and the mic, but I can always press into use some of the little Walkman-type earphones I have laying around for the receive audio.

My application is for VOX operation under close-fitting snowmobile, ATV, and bicycle helmets. High ambient background noise and wind noise make a boom mic less than desirable. Also, use of breath-deflectors to avoid fogging the visor in cold conditions make using a boom mic a problem.

I'm looking for a set up that includes one or two small ear speakers since regular phones won't work either due to the tight clearances.

Tried a Premier SP-500 with the FT-530, not very satisfactory at all.

Might as well ask for a source for plugs to mate with the FT-50, too, so I can cobble the rig together, assuming I get a line on the headset/in-ear mic or throat mic combo.

Thanks for the help,

Steve Zettel KJ7CH

CTCSS Unit is only for receive. Sending the tone is possible without the
unit.
Only if you have a CTCSS unit and someone wants to call you, your
scquelch is only open when the proper tone is received.

Hi David,

Just before christmas I had a 55ft crank up/tilt over tower erected
here. The guy who installed it used a post hole digger to about 4ft
deep (as you mention), but after that he had an orgre bit to continue
to approx 8ft down.
The orgre bit consists of a circular cutting ring, just like a big
hole saw, but with the top open. Mine was about 12inches diameter,
with a wall height of about 6 to 8 inches.
The orgre bit must be the diameter of the hole you are digging.
The concept is that you cut into the earth creating a circular cut
around the circumference only.
With a crow-bar, or heavy steel pole, you must then compress the earth
inside the orgre after you have cut into the earth. Once the earth
inside the bit is compressed, you can lift the orgre out of the ground
and the earth will remain inside the bit.
A few hard whacks on the surface will remove the compressed earth from
the bit, and you can start over again.
The concept is a bit slow, but it works well.
The deeper you go, the more clay (and harder) the earth gets, this
makes the concept better, as the more dense earth tends to stay within
the orgre bit as you lift it out of the hole.
Let me know what you think.

Hi to all, I have a Yaesu FV-101DM external VFO. I thought it was for the FT-101 BUT, it's for the FT-101ZD. The VFO has 2 din plugs on it (6 pin and 8 pin) and the 101 has an octal socket for an external VFO. Now, will it work if I make an adapter plug from the din to the octal socket??? Or am I just spinning my wheels. I really don't want to try in fear of destroying them. Any help would be appreciated.

Thanks, Mark N2FLF

4186. Yaesu FT-8000 Fan Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-15 00:00:00 UTC
From: Peter and Colleen McGreevy <PMCGREEV@MAIL.IDT.NET>
Message-ID: <330571C6.7000@MAIL.IDT.NET>
Source record: 183232

Just plugged in the new FT-8000.... and I have a question...

Here is how the operation goes:

1-Turn the rig on, the fan does not spin (this I assume is normal...correct?)

2-Key up once, Fan spins on High speed for about 2 mins, (this I also assume is normal)

3-After fan spins on high for 1-2 mins, it runs at a low speed for the duration of the time the radio is on... This is what I think is screwey. Is it supposed to run continuously at a low speed like this???

Also, am I supposed to hear it? What ever happened to Silent Fans? I hear this when it is on low speed... a faint flutter sound.... is this normal?

ANy info would be appppreciated...

Pete

Another flim flam artist wannabe looking for some unsuspecting amateur to screw eh??

I have heard from several people that think that pointing out overpriced items in this newsgroup and others is a worthwhile effort, most especially if you mention where the item can be purchased for less.

In article <32F2AB99.57D2@mcs.com>, dtburr@mcs.com says...
>
>BS. No item on this newsgroup ever sold for more than a buyer was
>willing to pay. Pathetic indivduals, looking for a way to feel
>important, patrol the group looking for "violations" (as if they are the
>final arbiters of what the price should be). We need to discourage these
>sick, sorry little police. Buyers are perfectly capable of doing their
>own research.
>
>You have *never* seen any indication of gratitude from would-be buyers
>toward these losers. Yet they somehow feel that their servivces are

From: hershman <hershman@ix.netcom.com>
Message-ID: <3305527B.1A84@ix.netcom.com>
Source record: 183236

The Radio in the picture looks beautiful. Perhaps I should reconsider
not purchasing the Icom 756 since they all seem to have transmit phase
noise problems. The Yaesu FT-920 DSP looks like the Ft-1000MP . I wonder
if the DSP is IF or AUDIO. HOW much $$$$.
If anyone missed the original ad, Geoff Brown (a Ham radio dealer in
the channel Islands in the UK). Posted a picture of the new Yaesu FT-920
in his WEB page. That is SOLID PROOF FOR ME!!! The radio looks similar
to the styling of the ft-1000 MP-Ft-900cat. It covers HF and 6 meters.
I am really interested in the price. Is this radio competeing with the
Icom 756 for marketshare?
If anyone needs geoff Browns Web page I will get it for you!
CHEERS, NS1R Steve Hershman
pur
chasing the Icom 756 since they all have Phase noise problems.

4191. Re: Improving the SONY SW100E performance ?

Wow greg,
It almost sounds as if the radio doesn't hear very well without help
<no offence intended >.
I might be wrong, but I thought Sony sold the sw100 with an external
antenna amplifier included. If not, I have heard very good things
about the Sony AN-1 antenna gain contoller which I believe is
supposed to provide a flat gain throughout the sw range.
I tried the radio shack one out.....<grins>, the manager of the store
told me it was worthless, and It was obedient to his word.

There are a few external/powered speakers out there that are probably
realy good. You might try a radio shack computer amplified speaker.
These are not to expensive, and use a standard 1/8 jack which is
probably what you have on your 100 for speaker output.

All best fun,
Duane.

FM Broadcast reception is going to suck. The antenna isn't tuned, and
the filters aren't set (something like that..)

>2. DTMF Decoder. When I set my rig to decode DTMF tones I could not see
>any digits on the LCD panel.
>I am using my FT23 to send the DTMF codes. (FT50R User manual page 44) I

You have to have DTMF on so the phone icon shows, and hold F until the
F blinks, then 9. You will then see the DTMF.

>services.

I might add that unless the radio's that are modified to operate in
other bands cause a problem, the manufacturers have no incentive to
prevent the mods. It took an act of congress to get the scanner/ham
radio's to not scan cell band easily. Yes I know that there are lots
of them that can do that still.

The FCC doesn't look over your shoulder to see what kind of radio you
operate. People are always looking for the cheapest way to get a job
done. If that means getting a ham radio instead of an expensive
commerical, they will do it. The mods are all over the net.

I'm not saying its ok to do this, but that is how the market these days
is geared. The mods have proven to be a very popular feature and will
continue to be included in the radio's.

4195. FS: Motorola VHF Repeater

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-16 00:00:00 UTC
From: Rod Davis <rod/kc4neq@magicnet.net>
Message-ID: <3307916E.8CB@magicnet.net>
Source record: 182945

I have a Motorola mobile radio that has been duplexed for repeater operation by Versatel Commumications in Casper, Wy. This is a Motorola Canada "low band" (138-150 Mhz) radio that Versatel modifies by defeating the RX/TX relay, direct wiring of control and power devices, and adds another connector for the receiver. It transmits 40 watts and the squelch opens at .1uV.

You will need duplexers, power supply, antenna, coax, channel elements on your frequency, a frequency coordination, and of course, a site. (I added this information because you can't believe what some people expect to be included with a radio!)

I paid $275 and will sell for $125 plus shipping. The unit has not been put on the air since arrival. Our group has moved on the UHF instead. It has been powered up and checked out on an IFR 1200S, then reboxed. I will include a US Motorola service manual.

Please email me direct with any questions. I forgot to bring home the model number, but you wouldn't find it in an American Motorola book anyway.

I suspect the front-end tuner does not have enough range for this. I
suspect
it has three discreet front ends, like most double conversion scanners.
One for 100-200Mhz,
one for 400-500+, and one for 800-999MHz. These could physically tune a
little beyond their
ranges but if pushed too far: 1) the PLL will not lock on the local
oscillators, and 2) sensitivity
will be reduced by a high degree. Performance is peaked for the two ham
bands. So the
200-300 MHz cutout is due to neither 2M or .75M front ends can reliably
lock onto this. Some
units might get some of this if the logic circuytry is overridden.

As far as the ADMS family software, it may be possible to alter the data
file with a hex
editor to add these frequencies. They may be floating point binary numbers
so you need to know
the IEEE 754, etc. Take a file of known freqs to find the pattern.

Martin:

Just stirring up the pot a little, poking a little fun at those who would not buy a radio because of its "slick, finished look" or the fact that their advertising has too much "high tech" overtone. How silly!

Actually, Ten-Tec puts out a fine *basic* radio, but certainly not one that is more trouble free or can be considered by any objective measure to be a better value. Any love for Ten-Tec will almost always be subjective and based on reasoning such as that in the above paragraph which paraphrases a previous post. Don't forget that it's made in good ol' 'merica, which is another reason to put up with them.

To each his own. I'm not even sure if Ten-Tec is still in business, so the point is probably "mute" anyway!

> QSK. How smooth and quiet is the QSK? Are there any strange noises
> inserted besides the sidetone? How good is the noise blanker? what
> cw filters are recommended? Any comments would be appreciated

Hi Tim,

I'm delighted with my JST-245. I have the dual 500 Hz filters which I always use on CW and the digital modes. I also use a DSP59+ with the 245. It would be nice to have that DSP function more tightly integrated into the Xcvr, but I greatly suspect that I'll go through several generations of cheap DSP boxes during the useful life of my 245, so I'll keep my DSP function external for now, thank you.

The QSK (FBK) is so transparent that it takes a bit of faith to believe that you are actually xmitting. That all changes if you hook up an amp, though. If you short two pins in the amp interface you enable a noisy relay in the amp keying circuit. The side-tone level (MONI) is adjustable, as is the side-tone/BFO pitch. While the PITCH knob appears to be an analog variable control, it is actually being read by the internal control micro-processor A/D and the side-tone/BFO pitch frequency is actually set in discrete, perfectly repeatable steps of about 15 Hz resolution. The center setting is 800.0 Hz measured, so there is no trouble centering it in the passband of either the DSP59+ (800.5 Hz measured) or the CW detect frequency of my Kam.

The noise blanker is a big improvement over any other rig I've used, but it gets little use now that I have the 59+. It seems less susceptible to overload from strong SSB stations, too.

One nuisance on CW is that there is only one key jack, on the back, with a slide switch - also on the back - to switch between straight key mode and the built-in keyer. I solve that by generating all my CW from the Kam and KaWin.

I really love my JST-245, but I've met few owners of newer rigs who don't feel the same way. Good luck and 73,

Stan

I went into two stores last week to pick up a $5 part. The first one started by asking me for my name. I paused for about 10 seconds, then gave it. Then he asked for my address. I walked out.

At the second store, the guy didn't ask me for anything. I asked him about it and he said that he only asks about 20% of the time, usually when the person is making a larger purchase, not when they are paying cash for a small item or two. He claimed that the only reason he asks at all is that he gets in trouble if he doesn't get some listings.

Well, aren't we self-righteous today! In any event, as it happens I do own a marine radio. It is not portable, and is attached to my large boat. Therefore, it is not suitable for use in a small boat of the sort I rented on my last vacation. The FT-11 was much more appropriate, and, when the engine conked out in my rental boat in the middle of Puget Sound, I was able to call for help! So sorry I didn't use a "type approved" radio- I suppose it would have been much better for my family and I to row the ten nautical miles or so to the coast. In addition, Jeffrey, you really don't have the slightest idea what you are talking about with respect to performance- I have a fully equipped radio communications shop including a Service Monitor and both a HP and Advantest spectrun analyzer and shielded room. I've looked at both of the radios with respect to deviation, spurs, and frequency stability- they are fully the equal of my Midland marine radio. In fact many of the ham rigs are based on commercial designs or vice versa- for example the IC02 and the essentially identical Aircraft HT's.
So go mind your own business Jeffrey.

I pulled mine apart to clean the cystal cover as it had dust in it from the factory. It takes about twenty mins. from start to finish and all you need is the same jewelers screw driver that you used for the case screws and a pair of pliers for the knob lock nuts. It is rather simple just take your time. Also when you extract the circut board pay attention to the bottom board attached by ribbon (the button board). The mic is there also so don't pull hard, just up and out. And don't lose the LOCK swith. It will pop off when you pull the main board out alone with the PTT board attached to the side. You must pull the side of the radio a little out to pop the board out. And when you take off the lock nuts at the knobs you have to pull a retaining bracket up to set the top of the board free too.

I know this is out of order but thought these hints may help.
Good luck.

> is there a 2m HT that can be connected to a more powerful amplifier
> when used in a vehicle?

Yes....all of them. There are a bunch of amps out there that are RF keyed and all you have to do is power the amp with a sufficient 12V source, and connect an input antenna lead from the HT, and hook the amp output to the mobile antenna.

It doesn't matter which HT you're using. Most of the amps are rated at about 2W input, but some are rated for more or less, and they will work with less than the rated ionput as well.

I would like to use my 79A as the remote to my 733A.

I followed all the directions in the Appnotes. I power on while holding
PTT and MR and nothing happens.

Any suggestions would be great.

Thanks, Mark, N1XYY

Anyone wishing to register opposition for the ARRL/AMSAT submission should send a brief e-mail message to wrc97@fcc.gov. The Subject line should say "Reference No. ISP-96-005 IWG-2A." A simple statement to this effect, "I oppose the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal," will be included in the public record and will help to drive home the point that there is broad-based approval to well conceived 2 metere sharing proposals. It ought to be clear to the FCC the public good is poorly served by allowing hams exclusive use of these valuable
frequencies.

Please note! The proposals the League opposes are not FCC proposals, nor are
they endorsed by any other branch of the government. They are industry proposals. The League's objective is to falsely demonstrate there is broad citizen opposition to the industry proposals.

Additional arguments or evidence also is welcome. Important! Comments should
reach the FCC no later than March 4, 1997!

4212. ICOM 786 -PROBLEMS-, noise blank

Newsgroup: rec.radio.amateur.equipment
Date: 1997-02-16 00:00:00 UTC
From: Jim Menefee <offsite@southeast.net>
Message-ID: <33080BFF.793C@southeast.net>
Source record: 182962

I bought an IC 756 at the Orlando Hamfest (2/16). It seems that the NOISE BLANKER is making a POPPING noise, louder than the noise it is suppose to remove. The problem is very bad in busy band conditions (80M/40M at night). ANYONE HAVE A FIX...

So do you cut legal corners in all aspects in your radio shop
business, or just with your own personel communications?

My comments were directed to everyone who has asked (or will ask
in the future) "How can I modify my radio to xmit out-of-band?"
None of those posting such queries have a fully-equipped radio
shop such as yourself to analyze the results of their modifications
(they wouldn't be asking for such info in the first place, yes?) -
that you're encouraging people to screw around with their
radios without them having the means to check their actions is
morally wrong. If their radios cause problems to other services
(as a result of your suggestions) and they encounter trouble with
the authorities, in their own defense they'll certainly mention
your name ("He told me how to do it!").

I have to wonder about the validity of your radio shop claims -
you said "... cut some <colored> wire..." - that was rather
vague for someone with their own radio shop business.

>So go mind your own business Jeffrey.

That will never happen.

Do you also cheat on your taxes?

Source record: 182998

I just received my Icom 756. Nice rig. I am unable to determine what all of the problems are at this time. If anyone has a list of things to look for I would certainly appreciate receiving it. I have noticed that the 6 meter receive is a liitle weak and mandates use of the preamp at 2. Also the noise reduction circuit does not appear to work in AM. I aso found it necessary to fix the ALC voltage with a battery to improve AM transmission for upward modulation.

I don't know how high this tower is... but you are going WAY too deep

Unless you nave need to go that deep for most towers of a modest size a
4ft by 4 ft block of cement is all you will need... You may want to dig a
post hole sized section in the bottom of your 4X4 hole down to 6 ft or more
to make you feel good.

One of the Main things to remember is to use Lots of re rod... The steel is
what makes the cement strong.. at it is cheep..

Remember too... to place that cement you are going to have to figure out how
to move it from your driveway to your hole... 1 1/2 yard of cement is
heaver than you think :)

Dear "Ed and Brenda":

As I stated in the private e-mail you sent me much earlier asking this same question, the answer is that you may be beyond enlightenment. You are way too sensitive to be on the Net and should probably sell your computer.

BTW, what do you have? I have a friend who is looking for a low-end machine for e-mail purposes.

Dave

The RCI 2950 has several problems. It is a very Cheep copy of the
Summerkamp TS-2000DX. Now thats the radio to get if you can find one.
I have one my self. I am in to 2 meter and dont use mine any more. If
you can't find a new one check back with me. I may trade mine for a
nice two meter rig. I have never had any problems with my rig unlike
the 2950. I can be reached at vw54@riverview.net

Ok, hope my memory is sharp today... if I remember correct it's at:

http://www.kenwood.net

Just follow the path to the Ham equipment. It's where I went for it,
but has been a while since I was there.

Good luck.

I have heard a lot of people saying they have had problems with the RCI-2950. i have owned two of them over the past 5 years and have never had a problem with either one. FM mode works great, especially if you can find a 2m repeater somewhere that is crossbanded to 10m. I once worked a guy walking along LaGuardia airport with a 2m HT from my shack in Portland, OR, using the 2950. I've worked a lot of CW on it as well on 10 meters. And...I talk to a friend of mine who is not a ham, but has a sideband CB at home.

I really like the 2950 and have never experienced a single problem with it.

Source record: 183024

Hi All

I've had an FT-50R for a couple of weeks now, and it's a great little set.

My only real complaint is that damn PWR button ! It only takes a quick jab to turn on the set, so it keeps coming on when carried in a pocket etc.

Why the designers couldn't have put in a little delay before switch on, as they did for switch off I don't know !

If anybody has a commnets or suggestions I'd be pleased to read them.

Cheers - Pete GW0PJA / AA2DZ

Ok, the long beep and blank display is due to loss of 5v supply to
the control unit. This comes from the IF unit. Locate the +5v
regulator at the right rear of the IF unit and resolder all three
legs especially the gnd(center) leg. This will take care of the beep.
If it doesn't then the regulator is oscillating and need the input
and output bypass caps replaced. The tapping and curing it indicates
the problem is a cold solder joint though.

The regulator problem can also cause all kinds of strange problems
if it has a momentary loss ie: jumping freq etc...

The parts are available from Pacific Coast Parts (1-800-262-1312).
They are Kenwood's parts distributors. If you are fairly comfortable
working on very small components have a go at it. There is quite a bit
of work (appx 1 hr) in the changes if you know what you are doing.

The YK88SN is the coorect filter for the TS850 but to eliminate
soldering Kenwood mounted it on a small PC board to make it plug-in.
This is called the YK88SN-1. The small PC boards are not available
that I can find so my suggestion is to sell your filter and look
for the -1 version that will plug in...

C'mon Dave, let's be fair. We both like Icoms. From our correspondence both on and off list we both know that. I've also owned a number of Ten Tecs, including the little Scout. The quality and performance are both excellent. The radio does look decent. I've played with the Omni VI, and it is a quality radio. My current shack is Icom dominated, but I have one older Yaesu, a Kenwood, an Azden, and even a couple of mid '80s NCGs, which are fairly rare. Frankly, all are decent rigs. I've had some losers in my time, including, dare I say it, Icoms. Overall, I still like their rigs best.

Let's not turn expressions of personal preference into a flame war. It serves no purpose.

Re: the IC-756. It appears the phase noise issue is real, not planned. Overall, though, it seems it will be an excellent rig. Remember, the early IC-751s had problems, and take a look at the lifespan on the market, and the (deserved) good reputation the IC-751/751A have.

IMHO, expressing opinions is fine, disagreement is fine, but a little tolerance goes a long way.

73,
Martin

I don't know about you, but I sick and tired of people telling me that
things are "impossible"
when it obviously ain't so. It amazes me that things work as well as they
do in the world
with so much negativity and giving up.

> Look people. I asked for help! I would like to modify a ham rig for

It doesn't matter whether or not it is "illegal." If it saves someone's
life then that is much
more important than whether or not some stupid regulation is followed.

Good luck, I hope you get the mod.

Doesn't one part of the amateur regs permit communication by "any means
available"
during an emergency situation?

I was contemplating loading the local PD freqs into my portables in case
something
really bad happens. If I end up saving someone's life, even if I lose my
license, it
would be worth it anyway.

> Mmmm.... Wonder what else is wrong!

Look carefully at Table 2: E receives 144-146 and 430-440, while E3
receives 67-180 and 400-512 MHz.

It appears there is no way to get the 800 MHz band on "K" (U.S./Canada)
models, which should make Newt Gingrich happy.

Page 16 appears to be missing from the JPG images.

Anyone out there rewire the auto tuner connection so that the
little FT 890 receives through the auto tuner? I had done that
on my Kenwood 440 and it helps the receiver in many ways. I
plan to go in and look at the situation this week, just thought
I would check to see if any 890 fans out there have done this.
I really like this little radio and that is the only thing
(other than maybe the audio rolloff freqs) I would change.

Thanks.

Clark

I had the same experience with my MFJ-989C. The first inductor had an arcing problem, and was burnt at the midpoint contact. However MFJ quickly sent a replacement, which I installed and works great. This tuner is my "backup" and was pressed into service at 1kw+ for hours on end during net control sessions, working without a hitch.

A firend had the same problem with his inductor -- got very hot at about 600w. He also got a replacement, but took it out of service so I don't know how it is working.

I used an 'inverted' duplexer on my IC-706 to split out the 6m signals to my 6m antenna and the rest of the HF signals to the beam. 100w without a problem.

On UHF/VHF I use another one the other way to combine the UHF/VHF outputs to my single dual band antenna.

In short, when I asked ICOM the same question you have, thier answer was yes.

I should let everyone know that I finally got my dealer to perform the fix detailed in TSB 95-11-3. Of course they argued with me, put in a new AM/FM radio and after showing them that the noise was still there, they did the TSB deed. I plan on send ing a rather pointed and nasty note to the service manager expalining how inefficient the service was.

Oh well, My thanks to those that got me going in the right direction.
